The problem for SLIP/PPP isn't the web browser, it's the TCP/IP stack
you use : STiNG, STik, MiNT-Net. I dunno for Stik, but STiNG and MiNT-Net
are using PPP very well... :-)

The URL for STiNG :

http://www.ettnet.se/~dlanor/sting/html/file.html

1772. Falcon Parallel <--> Zip Drive!

Newsgroup: comp.sys.atari.st
Date: 1999-11-04 00:00:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.991104035727.24791B-100000@halifax.chebucto.ns.ca>
Source record: 71128

In an old issue of AtariUser (1993), it mentions the specifications for the Falcon030 and one of them is that it has a fully bi-directional parallel port so it can use all PC peripherals.

With this reasoning, it should ebbe able to use an Iomega Zip Drive. Are there any drivers on the market that may work with the Falcon to allow it to access the zip drive? I know there are SCSI utilities but the Falcon is supposed to be able to handle 2 way parallel communication with a zip drive.

How hard would it be to port Iomega drivers over to Falcon use?

Thanks...

though.

I've used a pair of DOS programs called FDREAD and FDFORMAT to
read/write odd disk formats on a PC for quite a while - FDREAD should
allow the PC to read extended format disks, although in the main I've
used FDFORMAT to create larger sizes to reduce the number of disks
needed to copy stuff to a ST - works quite well under DOS, maybe a
Win95 DOS box too, but NT4 doesn't like odd sizes at all!

Look for fdform18.zip in the DOS archives

Hope that helps...

Gio

STinG and STiK can cope with PPP and SLIP.

All the TCP/IP's I now of on the ST's cater for it. It's CHAP and PAP
that's the problem!

Has anyone sorted CHAP & PAP out yet as this will open a new world for
many Atarian's, as most of the free IP's use one of these 2 protocols.

<snip>
>...but the PC has great trouble reading them, therefore
> Makedisk can't do it's thing.

A few things:

You aren't trying to "dir" the disk are you?
This will not work!

You aren't trying to read (via makedisk) protected/original games disks?
This also will not work.

Make sure you are using the correct parameters with makedisk.
I always forget whether I should use /CREATE, /READ or /WRITE! :)
It should work, alternatively download the stuff you want, plenty of
sites around!! :)

Hope this helps!

1780. Newbe questions for ST520

I got an ST520 made in 1986 without hard disk,
with a 360K single side floppy drive and
without a system disk. (without any disk)
What can I do with this computer?
Where can I find an apropiate TOS image, preferably
in english, and how can I write to such a
floppy in my PC Linux - or Win95.
What about programs for it?

Thanks,
Karesz.

For a SCSI/ATAPI Zip drive. The parallel port one needs a special
adapter with special driver software.

Pea,

(How interesting. One of my family crests
is a turnip.) (grin)

Welcome to the on-going world of the Atari
ST. What do you have in mind for your new found
computer? Did you say you had an instruction
manual for the Mega ST/2? I have some left over
pieces of a Mega St/4 that was donated to the
club a while back. I gave the main piece to our
hardware person to replace another person's
machine, I kept the keyboard for my TT (and
loving it) and I have some odds and ends.
At any rate, welcome, hang around, and have
fun. I'm currently doing all my home computing
on an Atari TT.. E-mail, newsgroups, BBS'ing,
Internet surfing, desktop publishing, games,
music, Macintosh emulation, and I hope someday
8-bit emulation and programing. Great machine...
I just about retired my 040 Macintosh for an 030
Atari. :)

Take care!

I hear what you are saying. And don't let
these "wise guys" get you down. ;)

Truth is, when it comes to more ST and TT
ram for the TT, it seems the best option that I
picked up from the conversation might be..

1) Find a used one. Always a good option.
2) Find a 2 meg card, then upgrade it by
someone who knows what they are doing.
this might actually be the most costly
solution.
3) Buy a 8 meg card from a vendor.

That's the ST ram side. And it seems the TT
ram has all those options, and both seem to have
the upgrade board with the sim slots. Yahhh!
Making a new board might be difficult at
best in a market that still has some options.
Where there seem to be few options in the TT
world that might need addressing are the areas
that have actually been covered, but these days
need a solution for those still here...

1) Accelerator boards.
2) Graphic Cards
3) Ethernet cards/adaptors

And the list goes on. I have resolved
myself that unless I stumble into a use
Cattamoran card for the TT... I might as well
enjoy the speed I got. And I do.
So there is my conclusion. The discussion
for me taught me the options. If someone were to
make a card before I bought my ST ram card, I
would consider it. But why stop at a ST ram
board at 10 meg? Is more possible? Load that
thing up and give it options no other board can
give.. now that would bring in the bucks.

Take care!

Honestly, the most you can really do is play games unless you wanted to spend a bit of money upgrading, and for the expense, you could get an enhanced version called the STe which can be used to do almost anything you could with the WIN95 Box

There is plenty of share ware and free ware available to do write letters, and play music and creatwe clip art.

The floppies are standard SS disks, you should be able to use these on the Win95 box

The order in the Auto folder should be like:
DRVN.PRG should be started before any program that makes use of it.
SCC.PRG should be put as far back in the Auto folder as possible
SOCKETS.PRG should be put *BEHIND* SCC.PRG

>I-Connect Stalls during "Negotiating PPP Connection" with a error mentioning
>"Timeout during PPP Connection". Double checked my login script, including
>password and login name typos.
All I can think of is that you choose the wrong modem port/speed....
Select MODEM2 and a speed of 115000 in ICONFIG.

Don't include a script file... just enter the password, login en telephone
number from the ISP... Take a look at the log file, this should tell you if your
ISP has accepted the password & login. It will also show you why the link is not
negotiated correctly.

>I don't know of any special parameters that my ISP needs, so I'm once again
>stuck. Will upgrading to 2.7 help?
No, upgrading for the sake of getting connected will not do any good.

>
> Any ideas on how/if this could be done?
Yep, but using a complete different approach then yours or Branco Badrljica...

On the PC and Mac they sell TV-Cards, these are mounted on the graphic Card and enables one to turn his monitor into a TV... These TV cards are also sold as an external standalone box, they contain a RF-input and VGA IN and OUT.
With a simple RF cable you can connect the Atari to the box, select channel 36, and hook the box with a VGA cable to your monitor. That's it really. With this connection you'll be able to see the low and medium resolution like you've never seen it before. To get the high resolution you need a ST-VGA adaptor, which you connect to the VGA IN of the box, although this is not necessary because you could connect it straight into the monitor, but it will save some wear and tear on the cables and connections...
These boxes (VGA TV Tuners) are inexpensive and besides being able to display the Atari resolutions on a VGA monitor, you get a TV thrown in, and over the RF port you can connect a VCR, DVD player or Sony Playsation also.

Cheers from Belgium
Dennis

Please direct all replies through E-Mail at bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I don't regularly check NewsGroups.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. We meet the 2nd Tuesday of each Month. Our Next meeting will be Tuesday, November 9th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get together with other Atarians. Make friends, meet new people, maybe find an old friend. Eat Pizza, drink Pop or Beer in a decorative atmosphere. Bring your family to a family friendly place. For more info try:

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President Ben Smith at (503)256-9974 See you there!

> How do I get this emulator to work? I have TOSBOX & Pacifist &
> WinstoX and they all work, but this one is doing my head in!!!!

Actually, I find this one much better than all three of those. The
first thing you have to do is read that readme.txt you got with it. It
will tell you to put your TOS rom in the root of your C:\ drive. I
guess this is the problem you have.

Cheers!

al povero All :
S> Has anyone sorted CHAP & PAP out yet as this will open a new world for
S> many Atarian's, as most of the free IP's use one of these 2 protocols.

Atari NOS correctly supports PAP. It should be easy to support CHAP, finding
the code from some PC NOS, but nobody asked me for it.

yes but you will probably have to partition it
it will be IDE as 2.5 SCSI are quite rare

You should be able to use any IDE or SCSI drive with the Falcon. Usually
drives from laptops are IDE drives.

From: dreibel@idirect.com
Message-ID: <dreibel-0511990902490001@ts7-61t-12.idirect.com>
Source record: 70960

Just to drop a line to let you all know that there's a story about computer user groups in the latest issue of Toronto Computes! magazine, and the Toronto Atari Federation is one of the featured groups in the story.

Saul Chernos interviewed me last month for the story, "Toronto user groups still thriving", and for the most part gives a good report on the club's history. Actually, I'm afraid he's painted me as a bit too much of an optimist :) .

I also wished they had done coverage of some of the other user groups in town, like Club Mac and the Toronto PET User Group - and included info on how to get in touch with these groups.

Still, it's great to have the club recognized in this way.

There's also a national edition of the magazine, so you may want to check out Canada Computes to see if we made it. :)

In this month's Edge magazine (UK) - there is a full-page Atari Ad for Producers, 3D artists and PC/Playstation programmers.
The ad has the Atari name and Fuji symbol on it - with the words "Atari know games" written under the symbol.

>AN1 know how to get the last ever edition (#16) if I'm not going to the
>show, and my subscription has now run out?

Simple, just fill in the form on page 10 of AC#15 and send a cheque payable to Atari Computing for 3.50 (or 5.50 for RD as well) to the usual address of Rois Bheinn, Overton Crescent, Johnstone, PA5 8JB, Scotland. The relevant details on a piece of paper will do just as well, we're not fussy!

:-))

Don't forget that AC/RPL will still be trading/in operation until early in the New Year, so if there are any back issues etc that you want, you can still order from us. However, much stuff is now in short supply so if there is anything specific such as a particular back issue of the magazine I would order now to be sure of a copy.

Kind regards

Mike Kerslake

> parallel port so it can use all PC peripherals.

I wouldn't think so - while the Falcon port is bi-directional it lacks the extra control lines of the ECP/EPP PC ports. TUS were working on a full parallel port implementation at one point but I don't know if they ever pursued it. PC manufacturers are also very reluctant to hand out any kind of sensible documentation that would allow an Atari programmer to construct a driver.

Basically I don't think you'll get very far connecting PC parallel port peripherals to a Falcon

Hallo Patrice!

PM>I am very happy to hear that. So maybe adding VDI routines for
PM>keyboard and mouse could be possible,

that would be great :-)

PM>and then to do an AES version (in a window ?).

Even better, but just a "nice to have".
I would have to reboot anyway in order to change resolution, because 320x200 on
a 1024x768 screen is, erm, tiny ;-)
Or would it be possible to multiply the pixels by two or four, in order to
enlarge doom's graphics, without consuming too much cpu time?

btw, I was able to start the program, kill it in MagiC's taskmanager, start it
again, no problem at all. No crashes.

PM>For the sound, maybe you could try the sound server

I could try to do so, but not before sunday.

Spoke to someone at SysSol's London office this afternoon, and there is no
projected date for an English release of MPC 6.1 as they are currently
translating "other products which have never been released in English".
Frustrating, but there we are. Anyone had any experience of dealing with ASH
direct from the UK and if so what their policy is WRT upgrading products
bought via System Solutions (ie upgrade prices etc)?

Doesn't this require some weird cable you have to build yourself? Not really
an option for me as anyone who's seen me with a soldering iron would be
quick to point out!

Any more info appreciated.

ISTR reading in here that this only worked from DOS and wouldn't work with
Windows loaded, which makes me wonder what it would do to a VFAT file
system, especially one on a FAT32 partition. Call me paranoid :-)

Anyone know how this thing behaves under Win98SE?

1820. Re: Cyrillic fonts for Calamus?

Newsgroup: comp.sys.atari.st
Date: 1999-11-05 00:00:00 UTC
From: Martin-Eric Racine <q-funk@funkyware.atari.org>
Message-ID: <Pine.MNT.4.10.9911050212480.173-100000@rakastaja>
Source record: 71087

The Bitsream fontset includes the main cyrillic characters, which
are used in Russian, but not the additional ones used in Ukranian
and other more complex Slavic languages.

The same map is used in TTF fonts, usually, but most fonts only
include the us-ascii part; most common European accented vowels
are usually omitted, while cyrilic is basicaly never there.

However, if you can find some type of conversion software, more
recent Windows-provided TTF come in Baltic, East-European and in
Cyrillic varieties, in addition to the usual West-European one.

> I see, thanks. Seems I was wrong then originally.
Only where it concerns SyQuest removable disk drives.
> But are you sure that this isn't just the order that your test program reads them?
No, that is why I included both removable and fixed diskdrive lists
Also the lists are downloaded in one operation into a buffer, no user intervention.
Also formatting is a sequential process, so the (P)list is also sequential .
That is not the case for the grown defect list, so I did not include those.
> It seems that writing only one side at a time is inefficient ....
There are advantages also.Head switching also costs time. On the other hand, this drive gets faster again when it fills up. Also ,
like peter suggested, if something goes wrong with the heads you may still end up with half of your data in tact.

Now if someone could do the same research on this matter for Zip and Jazz drives.

I am very happy to hear that. So maybe adding VDI routines for keyboard
and mouse could be possible, and then to do an AES version (in a window
?).
For the sound, maybe you could try the sound server (Oups, I forgot to
rebuild a binary version).

You can find an almost complete list of internet programs at
http://www.atari-computer.de/mjaap/update_uk/

To connect to the internet you'll need a dialer. Two freeware ones are
available: STinG and MiNTNet. STinG is more popular and supported by a
lot of internet clients (e.g. Lonny Pursel's AtarIRC).

There are freeware programs for all parts of the internet. However,
there are commercial clients as well and they are in most cases easier
to install and use.

Greetings,
Matt.

1826. iCab

Newsgroup: comp.sys.atari.st
Date: 1999-11-05 00:00:00 UTC
From: "B.P." <virtb@bellsouth.net>
Message-ID: <L4uU3.26151$l22.235121@news1.mia>
Source record: 71093

Hi all,

I came accross a really nice article about iCAB for the Mac. The link is below

http://www.webtools.com/story/browsers/TLS19990629S0003

I sent the editor the following message because i cannot stand people who pretend to be experts and have no clue. I still use my F030, and enjoy the ability to choose what computer to use. Using an atari is partly about the freedom of choice. When editors leave out important facts in report, they help restrict everyones freedom of choice. How many Atari computers are sitting in closets because their owners do not know they the computer is still useful? A little publicity where it is waranted is always nice, and Bruce needs to be taught a lesson. With out Atari Computers, there would be no iCAB.

Off of my soap box now!

B.P.

PS: Go give Bruce hell, follow the lionk above

Hi Bruce,

I read your article on iCab and am looking for all the exceptional features that CAB (Crystal Atari Browser) has offered users of an ancient computing platform called the Atari ST (and Falcon 030, as well as several clones.)

If iCab turns out to be anything close to the original CAB, both Netscape and Microsoft better run for cover. If ou do a search on any search engine for Atari ST emulation, you will find tons of links to a program called pacifist, and winston. These are Atari ST emulators, and should run CAB for the Atari off line.

BTW I still use CAB and my Atari Falcon 030 at its impressive speed of 16 mhz to surf the net, and text based sites run "faster" than my 333mhz with IE5. Figure that out.

It amazes me that the so called experts out there are not aware of thriving communities of users who do not have a mac or PC. It's people like you who are the experts who don't do your homework and help promote the near monopolies of the big 2 operating systems. Unfortunately Atari went out of business, and Alexander Clause(sic) could not afford to work for such a small market, otherwise there would be more alternatives. I for one would prefer to use Ataris TOS and CAB on a my 33mhz computer and unlock it's true potential.

If you are going to be a professional writer, and a so called expert on computing, tell the whole story. This is what freedom of speech is about.

Yes, I've used Thing with Geneva, but I prefer Neodesk. Although, when I ran thing it was after I had already booted with Neodesk, so I could switch between desktops, I didn't find any probs with it though.
Interesting thing to note is loading a desktop, then a different one, and then the previous one again, and so on until you have run out of memory, I did this once for a laugh, don't ask why :)

Oh well, back to my little hovel :P

> Hi, I have a 2 gig 2.5 inch hard drive from a compaq laptop, can this be
> used in place of the Falcons internal hd. Also, how do I tell if it a scsi
> or IDE drive.
>
> Thanks

You -should- be able to use this drive. To determine if it is a SCSI or IDE unit look at the data connector. Usually 2.5" IDE disks have a 44 way connector whereas SCSI disks have a 50 way (+ 4pin power). Also SCSI disks are very hard to find in 2.5" diameter size, as laptop makers can get IDE units MUCH cheaper than SCSI units.

You will probably need to partition the drive (use the HDX program if you are using AHDI, or HD-driver's util program if you are using HD-driver. HD-driver is probably better to use with a disk that size too. Also, DO NOT format the disk because that can cause trouble...IDE disks don't need to be formatted if they move from a PC to a Falcon, just partitioned only...

If you aren't sure about the type of drive send me the model number and I'll look it up for you on the net...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

About a year ago I ran into one 8-bit
Atarian that was recording cassette games into
real audio files and then put on the internet.
Hopefully I can find him again.

> > >
> > >> Is there a way I can use a 3.5 ide on my F030, also can I use any 2.5 in
> > >> IDE in the F030

Yes a 3.5" drive -should- work. I use a Quantum Fireball 1280A 1.2 Gig
with an
adaptor (2.5" -> 3.5"). The Quantum needed 5V and 12V power but the adaptor
didn't have 12V so I spliced a 5V/12V supply to the disk from the Falcon PSU
to motherboard connector.

It installed a breeze, and intensive testing reveals an average
throughput of
about 2.6 Meg/second! Rather nice!!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

1839. Spin problem with MagiC

Newsgroup: comp.sys.atari.st
Date: 1999-11-06 00:00:00 UTC
From: mb@gem.win.co.nz
Message-ID: <FKr4wu.9r@gem.win.co.nz>
Source record: 70987

A member of our local Atari club is using Spin version 0.34 under MagiC version 5 to access a SCSI CD-ROM drive attached to a Falcon computer. This configuration has been working fine for a couple of weeks. After upgrading to MagiC version 6 this configuration no longer works properly.

The message from Spin during booting is as normal and the CD-ROM drive is identified. But after double clicking on the CD-ROM drive icon at the MagiC desktop an alert appears indicating "Error 46: invalid drive." This appears to indicate that the drive is not present.

I have tried using different BOS drivers and various settings, and in all cases the CD-ROM drive is identified and there are no error messages while booting but the drive remains inaccessible.

SPINMAGC.XFS is in the C:\GEMSYS\MAGIC\XTENSION directory and METAXBS.PRX is in the C:\AUTO directory. I tried renaming METAXBS.PRX to METAXBS.PRG without any improvement.

I am not very familiar with MagiC and after trying all the obvious adjustments we have not made any progress. Therefore I would be interested in any hints from MagiC users as to what might be the problem.

MetaDOS works fine on the same configuration but only under TOS. If Spin will not work with MagiC 6 then MetaDOS would be an alternative, so any hints on how to make it work with MagiC would also be appreciated.

> > must I apologize for this ?
> Yes, Macs tend to do that, they educate the poor lost souls and transform
> them into a new entity, They become "Mature" (scarry)

Please, don't assign myself to a computer name anymore .... I'm simply human ....
you definitely aren't.

> > I never will.
> I don't think anyone expects you to apologize for anything,

I DO think you were expecting such a post to attack again with your international
atarian hymn.
I don't know which song you like but I do not like any computer hymn.
I'm a simple experienced user whatever computer I'm using.

> you are free
> of your choices

Don't tell me again for what I'm free .... these are basics life things for which I
don't need any counsells.

> , just annoying to bash on the '15 years old mentality' (as
> I imagine you see the last remaining atarians)

Your imagination is bigger than your sincerity.

> or telling them how stupid

Your sincerity sometimes seems bigger than your imagination; what is exactly your
strenght ?
Imagination or sincerity ?

> it is to buy an OverPriced MilanII or such.

EVERYONE here is absolutely FREE .... you definitely aren't. You mind is darked by
computers.

> You made your decision,

Can you tell me how anyone can do something else ????

> You seem happy,

You don't :/

> why can't you be "REALLY" happy?

Why do you seem to have so much imagination while you definitely haven't ?

You have made your choice since a long long time ago .... it was the good one for you I suppose.
Why can't you simply discuss ?
Why is your imagination and sincerity so poor to make me so stupid ?
Do you really think I'm ?

I have something you don't have : imagination but I intend to use this quality NOT to blame anybody.
That's one of the most important things which separate our minds ....

A discussion group you say .... definitely not with you.

Jo

> network at 2MB's to a PC through a parallel cable and uses the PC as a

2MB?? correction, that's only between two PC's, only 100 kbps for an
atari and a PC... I quote :

... Between two PCï¿½s Smartnet98 can transfer up to 2 Mbytes/s (120
Mbytes/min), between a PC and a Atari also some 100 Kbytes/s ...

:-)

> bridge to gain access to networks and the Internet, it comes with all
> the necessary TCP/IP drivers and such, looks like a good product to help

> hook their ST to the Internet via high speed connection and use CAB 2.7
> to get on the net!
>
> http://rcswww.urz.tu-dresden.de/~sb227788/english/products.htm

This stuff already exists a year. I even mentioned it on my pages in
March of this year, see :

http://gallery.uunet.be/saka/atari/lan/smartnet98.htm

One minor point about this : you always need another computer close to
the atari if you want to branch your atari to another type of network
(read ethernet network). And the speed won't be that high (100 kb/s).
So it even might be better to buy yourself a parallel ethernet adaptor,
make a little romport device, use the STinG drivers of Vassilis and you
can connect your Atari immideately to an ethernet network.
The price of the SmartNet is around 60 euro, a complete ethernet setup
like discribed above around 90 euro... so my choice is easy made.

Does sound like a configuration problem if it worked before. I'm running Spin! here with the same basic setup as your club mate under MagiC 6, no problem.

So.

Check that the CDROM's ID is checked in HDDriver's config, or if he's not using that make sure that SCSIDRV.PRG is present in the Auto folder.

if you haven't heard the news yet, then here it is...

http://www.msnbc.com/news/329416.asp

"WASHINGTON, Nov. 5 • The judge in the historic antitrust trial of software giant Microsoft Corp. ruled Friday that the software giant wields monopoly power in personal computer operating systems and issued a decision highly favorable to the government."

JUDGE THOMAS PENFIELD JACKSON said that •to the detriment of consumers ... Microsoft has done much more than develop innovative browsing software of commendable quality and offer it bundled with Windows at no additional charge.• As has has been shown, •Microsoft also engaged in a concerted series of actions designed to protect the applications barrier to entry, and hence its monopoly power from a variety of middle-ware threats including Netscape•s Web browser and Sun Microsystems implementation of Java,• the judge said."

Spin this, wintrolls.

Hi!

I am interested to have some noisy AIF- sounds (smaller than 1,4 Mb) if anyone like to share, I can give other sounds back! I am looking for sounds I can use instead of drums.

Is it possible to send as a e-mail and pack as a ZIP file, I don't know!

Thank you!

Eyestone!

Have recently seen advert on TV for 'PONG' by Atari -- on PlayStation !!!

Hasbro not mentioned at all in the advert -- this will be the way it
is -- Atari name on other console platforms -;)

Well at least the name will be seen and the games purchased - I have
a PS to game play so I shall get the ATARI games as they are released.

:))

I don't suppose you have any STE power supplies, do you? My 520 STE's PS is occasionally a bit flaky, and I woulldn't mind getting another one just in case it completely quits on me.

1855. FOR SALE: Atari ST, TOS 1.4, 2.5 MB RAM

Newsgroup: comp.sys.atari.st
Date: 1999-11-06 00:00:00 UTC
From: djsmith <djsmith@baroque.net>
Message-ID: <382498A2.779D862D@baroque.net>
Source record: 71003

Two 20MB SCSI drives

Lost of music applications with original manuals:

- GenEdit editor librarian (with my own fabulous Roland D-70 editor
thrown in for free)a v. 2.0
- Band-in-theBox Gold.
- EditTrax Gold
- lots of system enhancing system utilities
- Lattice C development environment

Great for studio MIDI musician who wants a "plug and play" studio
system or MIDI tinkerer.

$200 takes the whole thing.

I'm located in the SF bay area. If you need it shipped, that's
extra.

1856. Re: FOR SALE: Atari ST, TOS 1.4, 2.5 MB RAM

Newsgroup: comp.sys.atari.st
Date: 1999-11-06 00:00:00 UTC

Message-ID: <38249AFC.1908BB9B@baroque.net>
Source record: 71004

Repost with additional info:

- Two SCSI dries for a total of 40MB disk space.
- SC1224 color monitor (also a B&W available)

Lots of music applications with original manuals:

- GenEdit editor librarian (with my own fabulous Roland D-70 editor thrown in for free) v. 2.0
- Band-in-theBox Gold.
- EditTrax Gold
- lots of system enhancing system utilities
- Lattice C development environment
- other stuff that I may have forgotten to mention. Both drives are almost full of software! I have manuals and original disks for most of it. The rest is downloaded shareware (nothing illegal).

Great for studio MIDI musician who wants a "plug and play" studio system or MIDI tinkerer.

$200 takes the whole thing.

I'm located in the United States, San Fransisco (California) bay area. If you need it shipped, that's extra.

Is there anyone who can give me a complete description of the Blow-Up
'030? There seems to be little or no information available about it.
At this point I'm not even sure if it's a piece of hard- or software...
perhaps it's a combination of both.

How does it work? Is it a card? Will it work with my VGA monitor..?

Thanks!
Derek

That's good to here. Better to be portrayed as an optimist than not to be portrayed at all. Unfortunateately I haven't been to your club in roughly 2 years now, since I first returned to the ST/Atari scene with my old 520ST. Soon after installing STing/CAB/NEWsie I soon found myself purchasing a MEGAST, A TT and A FALCON. One thing I have noticed that is consitant is that Atari Users continue to leave the platform as they have done for more than a decaded and yet users are still here and many new users continue to appear. No matter what niche they fall into and what OS/ or Atari Clone they may be using, in the end the are Atari Users.

I too would be optimistic. I actually have an interest in the developments occurring in the land of the kiwis. Cable modem access and expanded colour for my TT would be awesome. Actually nothing would make me happier to cart my 15 year old ST over to my coworkers place and hook it up to his cable system.

Now for the bad news. Well not bad for anyone else really. I switched jobs that should allow me to get out to your meetings roughly every other month. Unfortuneately this is the month I really want to attend, and have to work afternoons that week. "I feel a cold coming on, it could be developing into a very serious 1 day illness::-).

Anyways, keep up the good work. What could be sweeter to an Atari User than to know that there will actually be new software and hardware in the year 2000.

Optimism....possibly, reality ....abosolutely:-).

Later Brian.

There is alot of software in ftp sites and certain web pages. However...

>
>The floppies are standard SS disks, you should be able to use these on the
>Win95 box

The floppies are standard 720k disks or refferred to as 1meg capacity floppies. The 520 you speak of, you state it is single sided, therefore it can only format one side.

You don't need any tos image. If the computer turns on and you see a couple of icons and a trash can you will likely have a functional computer.

You also fail to state if the single side drive is an external sf354 or an internat Single sided drive.

Now to get the software you will probably be downloading to a Windows computer. Generally both LZH and ZIP files can be extracted. However I don't believe that Windows formats and lower than 720K anymore. I think you should still be able to format a 360k disk in DOS but I am not certain as I have virtually never used a PC. Now unless you are very lucky, the early ST formating of a disk cannot be read by a PC, but a disk formated on PC can be read by an ST. Therefore in your case you are limited to a format of 360k.

To make certain that it is only a 360K drive highlight drive Icon A and select format fromt the file menu. See if the DOUBLE sided option to format is available to you.

Hope this helps.

Well, if it's the same product, I *used* to have Blow-up Hard 1 in my Falcon. It's a little hardware device that plugs in somewhere on the mother board and terminates in a switch that you use to switch on the higher clock frequency. Coupled with some software it allows you to expand your screen resolutions. It will work with both RGB and VGA video.

With RGB, you can get a decent true colour resolution, although I normally use a SVGA monitor. My standard resolution was 880 x 640, 16 colours, 72Hz refresh. Bear in mind that you are still using the main processor for producing graphics so the system slows down considerably. That resolution provided a speed equivalent to an ST in high resolution. However, run it at 800x600 in monochrome, 75Hz, and the Falcon really flies and with no flicker!

I was also able to get a 1024 resolution in monochrome, 800x600 in 256 colours with either interlace or 60Hz refresh.

I believe you can get it without the hardware mod which means you won't be able to get as high a resolution because you're only using the standard clock frequency.

Blow-up 030 sounds like an improved model. However, I recently had my entire motherboard replaced and asked for Blow-up not to be transferred, as I have got an Eclipse card on order.

You have to swop two wires over at one end of the cable. I went to a computer market and bought a cable with 19 pin D connectors at both ends (I can't remember if they're sockets or plugs), and unsnapped the shell of one of them to get access to the wiring. Some plugs are moulded, which is Bad News :-)

I'm not sure if there are commercial cables like this, Laplink might be similar but I wouldn't guarantee it.

Hi...I've an old FA*ST ICD 80MB drive with a whole bunch of files on it, years of writing, stored up in a closet...the ST is long gone but I still have this HD full of files...I figured if I should ever have need for them, I'd be able to buy an ST or borrow someone's and make the appropriate copies to floppies for my PC.

I'm concerned though that the ICD driver used on the HD isn't Y2K compliant. Does anyone know anything about this? I know there was a date and time mechanism in the HD...do you think the machine might not boot come the millenium? Should I make sure to get it hooked up to an ST and get all the files copied before Y2K?

Thanks...

The amount of ram the CT2 can address depends on the version you have.
I think the earlier cards could be fitted with 64, and the lastest
with 128. Your ST ram is still utilized, the system needs it! You must
set "program flags" to "tell" the system where you wish the
application to run, fast ram, or ST ram.

> In other words will I have access to 32 (fast ram) + 14 (st ram) for
> a total of 46 megabytes ram. OR will am I stuck with a trade off?

CT2 Rev A allowed 32MB Fast Ram
CT2 Rev B allowed 128MB Fast Ram

Any Falcon only use 14 from his 16 MB ST Ram.

32MB Fast and 14MB ST Ram are 46MB, right, but the OS, Stack and
Videomemory is also in RAM. So you got an amount of nearly 40MB
free Memory if MagiC, jinnee and some other programs are loadet.
(With any older Rev A)

CT2 adds the complete amout of ST and TT (Fast) Ram to one
linear Ram area. User have to watch the program header flags.
A lot of software use the fast ram to run, not only as data storage.

>
>I'm concerned though that the ICD driver used on the HD isn't Y2K
>compliant.

What's the definition of compliance? That it will cease to
work completely or simply not store the correct date? This
is an issue which many people are confused about due to the
scare-mongering that's been going on ("Y2K compliant" is
now used by some companies as a marketing gimmick, simply
declaring so but not giving explanation of how it is
"compliant" and even if it's necessary; I've seen hardware
manufacturers claiming compliance for things like flat-bed
scanners, or perhaps I have just never seen a scanner that
needed to store the time and date?)

Consider: why should an Atari ST, with no battery-backed
clock, even know what the date is if you have never even
set it?

The year 2000 problem is undoubtedly a potentially very
serious one, depending on the context.

>Does anyone know anything about this? I know there was a date
>and time mechanism in the HD...do you think the machine might not boot
>come the millenium?

Highly unlikely. This is another example of how the
problem is not really understood.

>Should I make sure to get it hooked up to an ST and
>get all the files copied before Y2K?

If you're that worried, do it, but once again, if you've
never set the clock, the hardware has no way of knowing
it is year 2000 anyway...

Did you try to downgrade again to make sure that it's really the
changed MagiC version? Changing the magic.ram file should suffice...

That shouldn't make any difference (METAXBS is executed from within the
XFS, and the XFS finds it under both names).

MetaDOS works under MagiC just like under TOS. However under some
circumstances programs might see wrong current directories, and the
entries on U: will not be there...

Hi Djordje,Phantomm,

Sorry for the long posting but I think you will find it helpful.

On 3 Oct 1999 09:18:41 G, Djordje Vukovic wrote:
>I would appreciate it very much if someone would be kind to make a brief
>explanation (or point to one somewhere else) of ALL parameters in
>the STiNG's DEFAULT.CFG file: what is their physical meaning, required
>relations of their values, and how they may affect system performance.
>STiNG documentation is unfortunately very lacking in this point.

I emailed Ronald to ask him for some info on some STinG things that have
been puzzling me (although it runs great) and he generously gave up some
of his time to answer them. I thought I would post them here to help
other members who have had similar questions. He is a transcript of the
email he sent me:

RA:
You need not worry about me ever dropping ST support in STinG. It will always
continue to support the standard Atari machines including all ST/TT/Falcon
variants. One of STinG's unique strengths is its wide compatibility with
different TOS machines and various TOS and AES versions, and those are things
I will not give up.

SB:
>I have a question regarding the network enviroment option in the dialer, I
>find that If I input settings into the DIAL.SCR they do not all show up in
>the enviroment window if there are more entries than the viewing window, and
>the scroll bar doesn't seem to work. Am I making some sort of error here?

RA:
No, it is just that activating the environment editor was one of the last
updates Peter made to the dialer, and that code is still not debugged. It
is only recently (appx 2 months ago) that I received the full STinG sources
from Peter, and I have not yet had time to update all components, nor even
to get familiar with all the sources as-is. That will take some time yet.

SB:
>Also what is the "offset" button for?

RA:
Hard to say really, as all the source shows being done with that variable
is the single C statement:

"environ_offset = 0"

Apparently it is never used, though I am sure Peter had something in mind.
One possibility, which I might implement later, is that it could be used
to sidescroll the edit fields, as that is one feature otherwise missing.

SB:
>I only ask this (as my system is working fine) because I have 2 ISP's and
>was wondering if this is for entering multiple enviroment set-ups so maybe
>I could enter all these into the one script?

RA:
No, that is not its purpose, as Peter always planned for each ISP to use
a separate SCR file. He and I have discussed those aspects many times.

SB:
>I have looked all through the STinG documentation but cannot
>find any reference to this Offset + enviroment menu.

RA:
That is because the implementation was never finished, and it makes little
sense to describe to users how to do something if that still does not work.
:-)

The purpose of the environment menu as such is to allow entry of STinG
variables beyond those that the dialer affects by other configuration menus.
It is possible for any STinG client/server to define new variables, and then
demand that users enter these into their DEFAULT.CFG and/or DIAL.SCR files.
Peter wanted it to be possible to do this without editing DIAL.SCR in a text
editor, and I agree with that. But as yet the code still needs improving.

SB:
>Also is there somewhere where I can find out the meanings and explainations
>of the entries of the STinG.CFG and Dial.SCR so I can fully optimise my
>system?

RA:
I won't go into a *full* explanation here. That would require an extreme
amount of time, and would also require that you are a networking expert in
order to follow some of the explanations. But I will describe some of the
values that have a strong impact on speed, and whose ideal setting nowdays
vary quite a lot from the ones in the files of the release archive.
(Mainly due to new improvements in the STinG TCP module.)

The five most important settings are these (with the values I use):

THREADING = 10
That one also needs to be set the same way in the STING.CPX setting, as it is
really that one which rules once the CPX is started. 10-25 are useful values.
(The larger mainly for slow machines.)

DEF_RTT = 1500
This is the minimum allowed on Internet, and is needed for efficient use
of the 'slow_start' and 'congestion avoidance' algorithms (now in STinG).
(Note that the old default for this was 50 !!!)

MTU = 1500
MSS = 1460
These may be limited lower by your ISP needs, but if they are lower then
the overhead costs get larger (more packets per data amount). Some ISPs
recommend lower sizes just because some old software uses those as standard.
So if your ISP says to use 576 and 536 for MTU and MSS, then interrogate
them to make sure if that is really necessary. Modern server software on
modern server machines (lots of RAM) should always allow 1500 and 1460,
which have become something of a standard for most modern ISPs.

RCV_WND = 32000
That value was not useful before the new TCP algorithms were added, as it
only led to congestion then. That is now no longer a problem, so for most
cases a large window like this gives improved rates for bulk transfers.

It is also advisable to use buffer sizes of at least one MTU for all buffers
in the HSModem modules, but for that you must configure them with SETTER, as
described in HSModem docs. I myself always use 16 Kbyte for reception buffers
and 4 Kbyte for transmission buffers. Large buffers are especially important
for the MIDI ports, as they will otherwise drop lots of packets, as they can
not use hardware handshaking to halt the sending of the other machine.

Feel free to spread this info around, as I get depressed thinking that a
majority of the STinG users probably have badly optimized settings...
I also hope that this info is enough to produce efficient operation for you.

>Quite a few other members have also asked for this info so if it could be
>made available ie. STinG "Advanced" Doc then I'am sure this would help
>both me and all those other people who require this sort of info.

I do want to improve the docs in many ways, but I am still very busy with
other improvements of the various modules. (Most recently SERIAL.STX)
As yet only one other programmer (Vassili Papathanassiou) has joined the
project, so it is still a bit hard to find time for everything.

end.

Hope this helps.

Thanks again to Ronald for his time and it seems there will be lots more
improvements once he gets more familiar with the existing code which is
great news. Also any programmers out there who can help reduce the load?

Best Wishes
Sean

Only if the PC can read and write single-sided disks. But if you have an SS drive you would be well advised to swap it for a cheap, PC double-sided, double-density drive. You need to change the ID jumper to 0 and probably twist the Shugart connection cable so that the plug is the opposite way round to that used by the PC. Depending on the drive, you may also have to modify the Atari's disk cut-out to clear the ejection button.

Did you also twist the Shugart cable to plug in the opposite way to that
on the PC? If it is a SS drive the PC may not be able to handle it - I
don't know enough about PC capabilities these days.

It sounds to me like perhaps your old drive heads are slightly out of
line, and were when they wrote the disks. I have some disks that can be
read easily on my internal drive but not the external one, while others
are OK on both...

Hi,

Nebulus that is on Automation CD9 from my site (LGD) works with WinSTon v2r2
and a 1.62 TOS ROM (or earlier). I would recommend using a UK TOS ROM, but
I know it works as I was playing the game just the other night!

Cheers,

Rich

Source record: 71037

Repost with additional info:

- It's a model 520ST, expanded to 2.5MB RAM.
- Two SCSI drives for a total of 40MB disk space.
- SC1224 color monitor

Lots of music applications with original manuals:

- GenEdit editor librarian (with my own fabulous Roland D-70 editor thrown in for free) v. 2.0
- Band-in-theBox Gold.
- EditTrax Gold
- lots of system enhancing system utilities
- Lattice C development environment
- other stuff that I may have forgotten to mention. Both drives are almost full of software! I have manuals and original disks for most of it. The rest is downloaded shareware (nothing illegal).

Great for studio MIDI musician who wants a "plug and play" studio system or MIDI tinkerer.

$200 takes the whole thing.

I'm located in the United States, San Fransisco (California) bay area. If you need it shipped, that's extra.

reschke@muenster.de wrote:
: Did you try to downgrade again to make sure that it's really the
: changed MagiC version? Changing the magic.ram file should suffice...

I will recommend to try this. However I was advised that the problem started happening immediately after MagiC was updated by way of an automatic installation program supplied with the MagiC version 6 update, and that nothing else had been changed.

: Are you sure that you see *both* the messages from SPIN_SD.BOS and
: SPINMAGC.XFS??

I was not using SPIN_SD.BOS, but SCSI_CD.BOS as supplied with the Soundpool CD Recorder program. I also tried a couple of other drivers (from the extendos package I think) but always the problem was the same. Do you think I need to use SPIN_SD.BOS only?

I did see both the messages from SPINMAGC.XFS AND METAXBS (including SCSI_CD.BOS that identified the CD-ROM drive).

: MetaDOS works under MagiC just like under TOS. However under some
: circumstances programs might see wrong current directories, and the
: entries on U: will not be there...

This is becoming even more ridiculous: in this case MetaDOS does not appear to work under MagiC (but it does work fine under TOS with exactly the same configuration). Unfortunately I cannot remember what error was indicated in this case.

I also tried ExtenDOS (a somewhat old version I believe) but it crashed under MagiC and could not be used at all.

I will try to investigate further in light of all the suggestions that I have received. Thank you for your advice.

Hey, now that's not a bad idea! I will have to look into it.. Although it seems a bit too simple.. I was expecting a solution much more complicated than that.. ;)

thanks for the input!

I recently bought one called "Instant TV". You can hook an RCA-type signal into in (like from your VCR, game machine, or the "TV" output on an ST). I got it from a place called Tiger Direct (in USA). Go to their web site, and it has a price of US$49, but if you put it in your "shopping cart", and then check it's contents, it shows up as US$29. I went ahead and ordered it over the internet that way, and it arrived about a week later. Works fine. Now I can watch videos on my 14" SVGA instead of my tiny 3.5" LCD screen television. ;-) It has audio line in and out, video in and out, SVGA in and out, rca audio R/L in, antenna in, and s/video in. It comes with a remote, and software for your (Windoze) computer so you can even control it with your computer if you want. Of course that does me no good 'cuz my ATARI can't run that software! Check out www.tigerdirect.com. I don't know why they have the price the way it is.... maybe a mistake, maybe they're refurbished, maybe a closeout,.... I dunno. Maybe it's been changed by now.

Hope that helps some,

Clayton Murray
Seattle, WA USA

1899. AHDI/ZOO problem

Newsgroup: comp.sys.atari.st
Date: 1999-11-08 00:00:00 UTC
From: Guaka <guaka@smiley.nu>
Message-ID: <8056h4$k1v$1@wnnews.sci.kun.nl>
Source record: 70898

Hello!

After I finally got a usable version of ZOO (one that wasn't compressed as a ZOO-file...),
I can't figure out how I should use it!
The thing I actually want to do is install the harddrive on my newly found TT (out of the
dump!). I guess I will be getting some troubles doing that when - sometime in the future -
I will have the AHDI files. So my questions are:
- Can somebody give me a URL that explains me how I should use ZOO?
- Or else, can somebody send me the AHDI files I need?
- Is there a nice page that explains me something about AHDI?
- Is there a page that explains me more about the TT?

Greetz,
Kasper

My two cents,
Some of the problem may lie with the NG server. Sometimes my posts
don't arrive and if they do, might disappear leaving older posts
still there (Atlantic.net's NG). In trying out another ISP (Earthlink), I
don't have that problem. Also, you may not be able to follow-up to a post
with double (:)'s.
Ex.Post--- my post: my problem. With a follow-up comming up with

Whether or not SCSIDRV is needed solely depends on the BOS driver which
is in use. For SPIN_SD.BOS, you need SCSIDRV (or a compatible driver).

order to enlarge doom's graphics, without consuming too much cpu time?

I planned to do a zoom routine (but it is not done at the moment). It is
a good idea, but it will be a bit slower. A better idea would be to
rewrite parts of the engine to directly render in the current resolution
(it requires some changes, but it has been done in ADoom (Amiga port)).
So it would be possible to do.

If anybody has information about reading key states (pressed/depressed)
on the Milan, please send it to me.

The same applies to SCSI disks. Formatting only makes sense when there
are bad sectors, in any other case it's a wast of time.

Hi Doctor,

well, the risk of being offtopic is here again, but I'm gonna take it.
Whatever the outcome will be, Mr. Gates c.s. will continue to force
users to upgrade. Heard him say childishly , all innocence over his
face, "We've always tried to bring people the best for their money" ?

Sure, go from Win 3.11 to 95. Buy new hardware, upgrades etc. And new
software versions (well, that's not MS fault, isn't it?).
Next buy Win 98. Need new hardware again, if you're lucky the old s/w
(the Win-95 versions that is) will continue to run.
Is it better? Yes, 98 is more stable but there are still lotsa things
they have to improve.
Now if you're really into biz, buy NT. It's even better (tho' not
perfect). Next one: buy 2000. Yessir, you'll loose the DOS part, so
lotsa software you're running is useless, but you simply buy new
stuff. I've seen some calcs that a migration from NT to 2000 will cost
you around 1000 USD for each workstation. That's on the MS part, not
on third parties stuff. We automated our kitchen this year, at a lot
of cost, running s/w based on DOS. They haven't got a Win version yet,
but are working on it. Now the plans are to get NT/2000 next year.
Kitchen s/w has to be upgraded for that at a cost of around 15,000
USD. Thank you, MS! Now I'm talking about the kitchen stuff only. All
the stock stuff, administration etc etc etc is DOS based. Nice going.
The problem is: once you're in, you'll never get out. Gotcha!!!

Source record: 70913

Hi, my TT's hard drive decided to die on me yesterday. HDDriver seems to recognise the fact that it's a Seagate drive but it cannot actually get the drive spinning (although the heads sound as if they're trying to read the boot info still! (iyswim))

What I need to know is if it's worth replacing the HD or should I get an external drive? (is the TT SCSI 1 or 2 - both internal or external)

If I decide to get a new internal then I've been told to ask about the power consumption as a modern HD could actually need more power than the internal PSU can provide - and this is the last thing I need!!

Anyway, I don't know much about HD's and especially fitting one! So I was going to take the TT down to Stafford and get someone like SysSolutions to fit me one. Good idea or should I simply get a new external drive (SCSI 1 or 2 though???)

Thanks for any help
(green)Steve!!

Steve,

Either SCSI-1 or SCSI-2 should work just fine in your TT030. Installation isn't a difficult matter -- should take about 10 minutes if you don't rush, then time for formatting and reinstalling your software. You're probably going to need to remove the bad internal drive anyway, so you might as well simply replace it with a new one.

Sheldon

Hey, we only need a 68020, around 20 MHz and a bit of FAST ram, is that too much to ask?
Such a thing for an Amiga 500 or 600 costs peanuts!
> I think some Viper boards for the Amigas just need to be put on top of the old processor
so why couldn't we just do the same or even adapt them

Mario Becroft has done (at least a prototype) of a very inexepensive accelerator for the ST.
don't remember how much acceleration though.

1919. Ifusion

Newsgroup: comp.sys.atari.st
Date: 1999-11-08 00:00:00 UTC
From: Pete Smith <pjsmith@zetnet.co.uk>
Message-ID: <382736dd$0$18010@znews.zetnet.co.uk>
Source record: 70918

Hi All

Can anyone tell me about a program called Ifusion,Which is supposed I think
to allow Stik/Sting clients to be usr with Iconnect.

Is it a reality?, Does it work?, & where is it available???
Thanks
Pete.

1920. 16/32 System Catalogue Update

Newsgroup: comp.sys.atari.st

OK, the basic web pages are now up, only two pages but it will be growing v.soon and hopefully v.fast.

The link is http://www.1632systems.co.uk from here you can link to Sales catalogue which should now be functional if a little sparse (graphically wise)

My thanks to those of you who have commented on catalogue and taking comments on board.
1) Hopefully postal rates are now sorted..
2) more graphics will be added with longer description, this will be over next two weeks.
3) On the web site, we will be archiving help files (cheats) for Falcon , Lynx and Atari games. These files will be available for download.

We do have other projects in mind so please let me know what you want to see.

That depends entirely on the scan range of the monitor,
and remember that the higher the resolution, the lower
the refresh rate, given a constant pixel clock.

High-end monitors tend not to cater for the lower scan
rates so you'd probably not get very high resolutions
on those.

My monitor here locks between approximately 50 and 120Hz,
and the highest resolution I can achieve while trying to
maintain close-to 4/3 aspect ratio is 704*544 at 49Hz,
before it loses sync. According to CENTVIDEL, pushing to
1,024*768 with a 50MHz VIDEL clock will give a screen with
24Hz refresh rate, but you'll have trouble finding a monitor
that will scan this low.

If you can get an Eclipse in there too then you get
1280x1024x16-bit...which is what I'm running now on a 21" monitor....It's
kinda nice.....I run at 1280x1024x8-bit for CAD work cos Scooter don't like
True-Colour, (on any resolution) it will only run in 256 or less....

Correct. iFusion allowed to use iConnect AND STinG clients with the
iConnect socked with one and the same machine. In witch way it works
itï¿½s a question for an user with iConnect. I only can tell you the news
from here..

> Is it a reality?, Does it work?, & where is it available???

It is real. You can take it from ASH germany.
Have a look to the ASH web site.

Yes, that's correct. There is also a version for Draconis. I did try a
beta version for IConnect with POPWatch and NEWSWatch. It should be
available through ASH and M.u.C.S. resp.

Bye,
/Pascal/

I recently bought a Seagate 4.55 gig drive (ST34520N). It has the same narrow
50 pin connection that the TT cable has. Don't know if it will hurt the PS
though. Found it on the internet at www.scsi.com.

Hi, I am experimenting with Thing 1.27, and color icons, but I am not able to make Thing display mini icons with colors, why ?

I checked the rsc file and the inf file but it should be ok with colors, Thing display the mini icons always with icon and mask color only, that is black and white. I tryed also changing the icon color to red and it works, but color I put in the icon in the rsc file is not shown.

> Money isn't the be-all and end-all of everything...just look
> at Linux. Also, effort to write games on Atari hardware may
> be cheaper due to less complex issues such as gfx/sound etc
> for PC's etc...

I fear IT IS anyway, to corporations like Hasbro who have no philanthropic objectives...

Linux is only a way to earn more money : it's efficient, it's popular and moreover it's free. And for Microsoft, it's a good argument to say they're not that monopolistic...

To gigantic corporations like Hasbro, there is simply NO ATARI MARKET. Even if a complete game could be produced in one single day, they couldn't get enough money back, compared with PC and PSX standards.
And anyway, there are STf, STe, TT, Falcon, Hades, Milan... computers, running under TOS, MultiTOS, Magic, Geneva... systems that all are Atari compatibles, but it takes time to make a program that will run on each of these systems.

It's much easier to program a Windows 95 directx or Playstation compatible game... And you might earn money from graphic cards vendors if you release a game that will run only on their cards.

From: mb@gem.win.co.nz
Message-ID: <FKxG66.pL@gem.win.co.nz>
Source record: 70849

Here in New Zealand there is still an Atari club and we are currently compiling a special large edition of our printed magazine, Tariland News, to be published in December. We want to include as much Atari-related material as possible, and the magazine will grow to fit what ever we receive (within reason).

Therefore we would welcome contributions from any Atari users, programmers, dealers or developers, in the form of articles or even advertising. It does not have to be long (but if you want to write a few pages go ahead!) and all contributions will be appreciated as long as they have some relevance to Atari computers.

Articles should be submitted as plain ASCII text. Pictures in most common file formats are acceptable.

Any contributions should be emailed to me at mb@gem.win.co.nz . You can also send enquiries to me at this address.

All contributors will receive a free copy of the magazine.

You can read about Tariland via our WWW page at http://tariland.win.co.nz/ , although there is not much information there at present - something I hope to improve eventually. We may even publish the text of the December magazine online although this is by no means finalised.

Tariland News is read by Tariland's membership which currently stands at about 25, and we also have a magazine swap with a few Atari clubs around the world.

Thank you for reading, and we hope to hear from you soon!

M> calculating-intensive tasks). Higher speed 68000's would result in a speed
M> increase in proportion to the clock speed (I think the fastest 68000

These accelerators tend to lose speed gain on higher clock speeds, since the
memory interface is still fixed at 8MHz, and the effect of the cache
is quite limited, especially when the cache is of write-through type
(all ST accelerators with a 68000 on were of this kind, AFAIK).

M> available is about 25 MHz, but you could probably over clock it to 32 MHz
M> AT YOUR OWN RISK). If there was enough interest I would manufacture
M> some

I have a 68HC000-16 running at 36MHz without problems - these CMOS
CPUs can take a lot more that you would expect from the datasheet ;-)

With local zero-waitstate fastram on the board, this beats a PAK-3
with 68030@36MHz (with cache, but without fastram) easily.

But no, this will probably never be produced in series - it was just
an experiment with a MagnumST and a glitch-free clock switch circuit
we wanted to test. Aixit had accelerators with 68000 overclocked to
28/36MHz, but *I* would not want to produce and sell such a beast.

Yes. A friend has one of the few that Atari made with 4MB, standard
was 1MB. Unfortunately, the display is broken and new 640*400 LCDs
seem to be impossible to get.

1942. Atari Falcon+Centurbo II vs 366 Celeron PC

Newsgroup: comp.sys.atari.st
Date: 1999-11-09 00:00:00 UTC
From: Joshua Kaijankoski <joshuak@isys.ca>
Message-ID: <s2gi6g986i784@corp.supernews.com>
Source record: 70856

I left my stock Falcon eating the dust and built myself a 366 Celeron system because the Falcon was extremely SLOW!! I ran it at 800 x 608 256cols so you can understand why. I don't want to run at lower res or colors and as a matter of fact I want higher res. It was a pain in the arse to browse the web and scrolling was just like walking through tar neck deep. I couldn't take it anymore so I switched to PC and at 1152 x 864 16bit color it's just blazingly fast. I really love the Atari computers and I'd like to use them as my main machine but the performance is just not up to date. I was wondering how the Centurbo equipped Falcon would perform compared to my setup. I am aware it's still got the ancient 030 at higher clock speeds but is it enough to compete against fast Pentiums? What are my options in getting the Falcon up to date? Centurbo II sounds nice but is it actually good enough? All I basicly do is browse the web on at LEAST 800 x 600 16bit color and super smooth scrolling. Can the Centurbo handle it? I know I could get a new Milan II but I want to resurrect my Falcon and see what it can do. What about other accelerators? 040? What's this Eclipse I hear about?

Joshua.

PS. I really love the Magic6 + Jinnee 2.01 + NVDI5 setup and I think it's a lot better than WIN98.

Many years ago a 50Mb ST147N siezed-up on me in the same way. I did the
pliers trick and then put a pinheadful of light oil around the spindle -
it's still working!!

1944. Re: Atari Falcon+Centurbo II vs 366 Celeron PC

Source record: 70858

AFAIK there's not a chance of any Falcon add on giving you the PC
performance you need. I think that a significant contribution to the
slowness of your Falcon Internet set up is the use of CAB as against
Netscape/Explorer on the PC. Even so, switching to not showing graphics
until you get to get to your required page and/or using the Autobrowse
feature for off line browsing, can make things bearable. And what's the
need to use 16 (T/C) bit colour, AFAIK most web pages use 256 as a max.
Even if you display at 16 colours in CAB, for quicker display, any
images you save are at their full colour resolution for off line
viewing.

> boycotting my posts? :)

I've had the same thing happen to me--only I thought it was my cable
provider's horrible news server at work. For emergencies, I've set up
an account at http://www.dejanews.com/ so I can make sure that CSAST
hasn't been blown off the face of the Earth. <g>

Interestingly enough, everyone's posts show up and stay there 99% of
the time, but I imagine DejaNews has some fancy backup-and-archive
mechanism at work..

To make things even more complicated, I just logged in at dejanews.com
and only posts from before October 18th, inclusive, were left.

Aaargh.. the saga continues..

Well, I decided to go with the external job anyways. Got myself a 4.3gb drive from Dabs today and partitioned it so that I can use it on both the TT and Falcon. Thing is, I started up the TT today and after two days of nothing it suddenly kicks in!! The HD started to spin and I was able to copy everything over to the new drive! Lucky or what :-)

I was told about this on Sunday though. My mate said this happened to his Amiga(spit). Well, it may be a dodgy drive from now on but at least I lost no s/w!! Thanks to everyone that's replied and emailed, appreciated.

I am not sure, but I believe about 400 were produced. Can anyone
confirm this? I paid about $2000 for it seven years ago, when it was
introduced here in The Netherlands. Mine turned out to be a DOA.
Well, it worked, but it crashed a lot. Some internal cables had bad
contacts. I returned it and got another one. That worked quite
well for a while. Then, one day, I dropped the suitcase from a height
of about two feet. From that point on, it no longer worked.
I took it back to Atari and had to have the motherboard replaced.
When I booted it, it worked fine. Unfortunately, it had a Spanish TOS
installed! No hablar Espanol. So I had the rom replaced by my UK
version. Then, later, the keyboard did not work well. These cables
are designed to be connected once or twice. When you open it
up a lot, the metal on the foil gets erased and stops making contact.
I had to have the entire unit replaced. I got one with an US keyboard
instead this time. Later I had the memory expanded to 4 meg by
a company called Trifolium. After that, the sleep mode did not
work properly. When you power down the machine, it goes into
a sleep mode. When you turn it on again, it picks up where you
left off, even if you replace the battery pack while it is asleep.
My machine sometimes refused to run after powering up again,
and it rebooted. I often shut down without saving, so this was
unacceptable. They corrected the problem, and now it runs okay.
I had to replace the NI-CD battery pack about four times though,
Since Atari no longer exists, you cannot get these packs anymore.
You can break the pack open though and replace the cells.
They are a special industrial size. Oh well.

And no, I will never ever sell this machine. I use it every day
since I commute by train. It is only 8 Mhz, and not as fast as
those flashy Pentiums, but hey, it runs Turbo C.
I also have a used one, paid $500. I also have a broken one
which has a broken LCD. These are special units produced
by EPSON, and even EPSON cannot supply them. I suppose

they only produced 400 of these.
I also have one motherboard in a display case above my desk
at work. It looks real nice.

I bought this really weird interface for the ST-Book that contains
audio and/or midi ports. I suppose it was some sort of audio
interface, although the ST-Book already has MIDI in and out.
I do not have software for this. It does contain a ROM though.
Anyone know what it is or what it can do?.
On the PCB it says: MUSIC MODULE C104628 REV.1
There is a Cirrus Logic chip inside: CL-CD180-10PC-B
This plugs into the side buss.

Anyway, nice machines, if you treat them right.
Keep those ST-Books humming.
(they do actually)

Might be wrth investigating, though in my case a serial connection would
probably be enough.

Ta for the info all the same: I'll incorporate it in the next update to my
web page about getting Atari word processor files across to PCs (which
includes strategies for file transfer).

I wouldn't worry about it unless you have some date-dependent software
packages (eg personal finance, spreadsheets etc), and from the sound of it
the data will be that old it's unlikely to matter in any case.

FWIW I have a page on Atari y2k issues at:

http://www.whalley.demon.co.uk/atari/y2k.html

... which will give you an idea of the issues which have cropped up in this
group (not many and mostly non-critical).

Eclipse plus an accelerator will get you close to Pentium...My Eclipse plus Nemesis Falcon manages 1280x1024 in 16 bit actually slightly better than the same size at 256 cos the Eclipse acclerates in hardware at 16 bit.....It certainly is as fast as my P166 Pentium at work for displaying pics....You need the Brainstorm| JPEG decoder installed though.... it really jacks up the speed of display of JPG's.....an Early Centurbo2 plus an Eclipse or hold on for the Tempest or find a Nemesis as a stop-gap.....

TBF though a PC will be cheaper...but I wouldn't want one, I prefer everything about my Falcon, I just want a faster one....If the Centurbo people put a through connector back on the CT2 or if Coretex manage to get the PPC equipped Tempests up and running then I'll have one...

I'm experimenting a little problem with MagiCMac6, the click of the mouse has a sort of delay, while the operations by keyboard are very fast. All the system works quick and good on this Quadra800, but you can see if you click to select for example an icon, that it becomes black (selected) after a small while, maybe a couple of tenth of a second, this is a bit frustrating when quickly clicking around on the desktop and applications. I experimented with various MagiCmac configurations (but I do not understand well german so it is a pain) , tryed with or without NVDI and other settings, anybody has an idea about what may couse the delay ? The mouse has not this problem in the Mac OS environment.

>Money isn't the be-all and end-all of everything...

It is for virtually any business. The entire purpose for just about any business is to make money. There are not too many altruistic businesses out there. And you can bet if I owned stock in Hasbro I wouldn't want them treating revenues as something to be toyed with (no pun intended). I would want them to invest wisely and not toss money at nostalgia just for the sake of nostalgia.

>just look at Linux.

Which is a hobby (or at least that's the way it started). It's not something that's trying to support thousands of families. Of course, Linux is starting to make tons of money for people, so I'm not sure that example even works anymore.

>Also, effort to write games on Atari hardware may
>be cheaper due to less complex issues such as gfx/sound etc
>for PC's etc...

I'm sure that's true. I'm equally sure that it's irrelevant. It would be cheaper still to not write any games at all. But again, the point of a business is to make money. It's not to create the cheapest product possible.

>I get the feeling Hasbro are backing the efforts financially
>but using the Atari name because of copyright issues...

Or the fact that it's smart business to use the name associated with those products.

Ifusion is bundled with fiffi, ASH's Iconnect ftp client.

As you say it allows one to use STinG clients with an IConnect
connection, especially good as I prefer aFTP over fiffi.

If nothing else rises to fill the void, this could become the successor to Atari Computing. No matter that the HQ moves from England to New Zealand, it's still serving the english speaking world. Before the announcement of the end of Atari Computing, I had contacted Joe about doing a comparison article on CAB, Adamas, and PC Netscape as far as performance is concerned, but I have had difficulty getting Heitman or MUCS to take any interest in getting me a full commercial copy of Draconis/Adamas.

Hi Joshua,

I'm using an FX accelerator with 10MB FastRAM (40MHz System and 40MHz CPU). With a 28.8 modem, I'm achieving about 1/2 the speed of my 300MHz K6-2 system with a 56K modem in downloading web pages. I'm hoping that obtaining a 56K modem will bring the Falcon nearly up to par with the PC.

If you want to try my setup, I'll take your Falcon for trade in credit toward mine. Otherwise, mine goes back up on ebay this week.

Money isn't the be-all and end-all of everything...just look
at Linux. Also, effort to write games on Atari hardware may
be cheaper due to less complex issues such as gfx/sound etc
for PC's etc...

I get the feeling Hasbro are backing the efforts financially
but using the Atari name because of copyright issues...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I didn't know that! Drat, maybe the 4 hours it took to format my 1.8GB
SCSI disk was not necessary!! ;)

Also, does 2.6MB/sec sound good? I get this with my new Quantum Fireball
1280A 3.5" IDE drive in my Falcon, in a test copying a mix of small and
large files to another partition. Its about x2 faster than my SCSI disk!!

:-\

Zoo is easy to use. It is a .TTP program. When you run it you should get
a box. Then type -e or -x (I believe they both work) and the file path
and name if the program and file you wish to extract are on the same
drive or in the same folder. If you have problems I can email you the
latest release of ADHI put out by Atari.

>that's the problem!

I have been using STing on my 520ST for 2 years now and it supported
PPP/PAP back then. Because that is only what my provider would offer.

>Has anyone sorted CHAP & PAP out yet as this will open a new world for
>many Atarian's, as most of the free IP's use one of these 2 protocols.

I believe it has been sorted out. However every ISP seems to have its
quirks. Luckily I have had little problems btw various providers.

1970. Another TT & Hard Drive Question

Newsgroup: comp.sys.atari.st
Date: 1999-11-09 00:00:00 UTC
From: "Atari-Users.Net" <rmahlert@delphi.com>
Message-ID: <8085hd$4av$1@nnrp1.deja.com>
Source record: 70935

Hello,

I bought a used 256 meg SCSI drive for my TT a while back. I installed it in the TT and booted the system up off of a floppy with ICD's drivers. The TT will reconize the new internal SCSI and my EZ-135 on boot up. I open up the c: drive (New SCSI), and I get the file directory like I should. But if I try to access a file the system freezes up and the drive light stays on. I can open all the folders I like, but the files all do the same thing, it freezes. Same if I try to format/partition the drive. My EZ-135 is fine.

Any ideas? Is it "locked"? Or is it no good?

Thanks in advance!

: see http://gem.win.co.nz/
: or send him mail at mb@gem.win.co.nz

I have never finished that accelerator ready for sale. It simply enabled a faster 68000 to be used (any speed) with cache. With a 16 MHz 68000 I was getting about 70 or 80% speed increase according to GEMbench (100% for calculating-intensive tasks). Higher speed 68000's would result in a speed increase in proportion to the clock speed (I think the fastest 68000 available is about 25 MHz, but you could probably over clock it to 32 MHz AT YOUR OWN RISK). If there was enough interest I would manufacture some of these. That means maybe 50 people committed to buying one. It could possibly sell for 100 to 150 US dollars (THIS IS A VERY ROUGH ESTIMATE).

However I am working on a much better accelerator board that I intend to finish next year, which perhaps makes this one redundant. It will not be very cheap though.

If you need to retrieve data from the bad drive, you could try manually spinning the platter by using a pair of pliers to rotate the spindle where it protrudes at the base of the drive (if this one of the original Seagate drives from the TT). This happened to ours a few years ago and we got it going again this way (only temporarily mind you)!

Oh, yes, it is right. And adding one zoom routine is easier than
rewriting all rendering routines in the engine.
But there are still many things to do:
- Adding keyboard/mouse control using Bios,Vdi or Aes
- Dsp rendering on the Falcon
- Sound using xbios functions on the Milan
- Music using dsp,sample playback, or midi port

Note that the SCSI level has nothing to do with the connectors. You can
add any SCSI-1/2/3 drive to your Atari. Usually it's best to use drives
with support of the latest SCSI level you can get. I doubt that many
drives already support SCSI-3. SCSI-2 is probably the usual SCSI level
with current drives.

Excellent! Thanks, I think I'll be trying for Scsi2 then.
But what about the power comsumption that I was talking about before?
What size of drive should I be looking for? I'm told there are 3.5 and
5.25 inch discs....??
Finally, are they real easy to fit? :-/ Is it simply a case of removing
the leads, unscrewing the HD and plonking in the new one and plugging
the leads back in. ? Sounds easy enough!
btw, will the current leads plug into either a scsi 1 or 2 drive?

Thanks for your help
Steve

Yes, this is possible with HDRIVER. Note that this has nothing at all to
do with formatting but only with partitioning.

Sounds like CAB with graphics turned off. It's pretty fast compared to
having graphics on, even with a 1040 STf with just a floppy disk drive and
1 mb ram.

From: Richard Davey <rich@fatal-design.com>
Message-ID: <38297e6b@news.gemsoft.net>
Source record: 70798

Hi all,

I've nearly collected all 86 issues of ST Format magazine but there are still a few issues missing, if anyone has any of the following (cover disk NOT required) and would like to sell them (or give them away for free) please get in touch with me ASAP!

Needed Issues:

2, 7, 14, 23, 30, 38, 39, 40, 41, 42, 51, 60, 77, 78.

In my quest to complete the set I have a few duplicates I'm willing to trade/sell:

54, 59, 65, 52, 55, 62, 64, 33, 24, 73, 46, 44, 68, 35, 76, 83 and the final issue 86.

Also any ST/Amiga Formats, I have the last three but the first 10 elude me.

Cheers,

Rich

I may have some of the magazines you need. I will check next time I visit my parents. If they haven't been thrown away (they were still there last time I looked), they're yours. I bought ST/Amiga format from issue 1, and continued for several years after the mag split.

I also have (or had) a pretty comprehensive set of Atari ST User and ST World.

I certainly still have the cover disks from ALL the magazines if you want them....

It already exists: disable all images in CAB.

If you're feeling really brave, use Lynx on a terminal console.
However, beware that Lynx is clueless on frames and tables; it
cannot display either ones adequately.

Hi Chris.

I installed the drive in the falcon, and HDX told me I needed to format it, i formated it, and HDX automatically partitions it into 4 - 11 meg partitions. If I try to partition it HDX tells me the root is bad and to reformat.

The drive is a (Hitachi dx225a -21)

It also has this code on it

(cyl 4188 h16 s63)

Have I screwed the drive up? Should I reformat it under DOS? Any help will be greatly appreciated.

B.P.

1987. Re: Tripod

Newsgroup: comp.sys.atari.st
Date: 1999-11-10 00:00:00 UTC
From: Mike <magicmac@my-deja.com>
Message-ID: <80civtcct1@nnrp1.deja.com>
Source record: 70803

Sorry you have to use LookOut, err, Outlook:)

The article said,

While your here, Dave :)

I have some problems with Tripods file saving. At times, say after you
have captured say, 30 or 40 images with Tripod, exit and go to view what
was captured , some files are written with 0 bytes sometime during the
session. The only way around this is to pay attention to the file size
while working in the fileselector, and if you notice a 0 byte file, exit
Tripod and restart to begin capture again. During the save process, the
progress bar seems to be working normal, with no visable difference
between a 0 byte file and a normal file during a save. At times, when
you mouse click to save a file, the applicaton just jumps back to the
capture screen, but I think that is related to a Falcon mouse bug
problem, and a different issue than Tripod capturing a file size of 0.
Any ideas? This is on an AB040 machine, AB took kit stuff, under TOS.
Occures under MiNT/NAES AIRC, and on my 030 machine, Expose and
ScreenEye

Thanks,

Mike

No, it's quite different. Services like AvantGo! for PalmOS and WinCE
actually cache web-sites for you, reformat and compress text and
dithers/downscales images to get shortest possible download-times. I daily
read four newspapers on my Palm and even with images (16 greyscales) it
doesn't take more than 80-100Kb.

I have been thinking about writing an AvantGo!-client for GEM, but since I
don't even have enough time for my existing projects I will probably never
no anything about it.

There's also WAP, but that's an entirely different thing which doesn't
make much sense implementing on non-portable platforms.

This "technology" sounds like the WWW as it has always been. Properly designed WWW pages can be viewed without any graphics, Javascript etc. and still provide all the relevant information. (Graphics can have alternative text specified, pages using frames can have an alternative non-frames version that is automatically displayed where applicable and so on...) Unfortunately it seems that most web designers have forgotten how to do this.

Night before last and then again last night I had troubles connecting to my isp (qnet.com). I picked up the phone and the connection tones where nothing like what I get normaly.

So I called up the tech support and they acted like it was MY system at fault, yet when I dialed manualy I got the same tones. 1st thing that they asked was I using w95 / w98? When I told them TOS 3.5 they put me on hold for 5 mins! (this a toll call too).

They then came back and said they couldn't help me as no one knew my OS, (gosh! how'id they figure that out?).

Funny thing, 5 mins after hanging up I dialed the access number and got the right tones then. hmmmm ...

Hi Patrice,

I tested it on my Milan last night and it looks great and runs very quickly. The frame rate is excellent, almost too fast, maybe it will be slower once the sound is working. I have a MilanBlaster sound card so I will be able to give you some feedback on that.

I tested it at the following resolutions using the Doom demo WAD under Mint/NVDI/Thing:

1024x768x64k runs fine in a small rectangle in the middle of the desktop
640x480x64k runs fine
640x480x256 runs fine but messes up the desktop colours as expected

It only runs the demo as there are no keyboard routines yet as you had explained.

I was able to terminate the process using Multistrip and run it again and again. I could even run other tasks in the background but they are a bit sluggish.

Once again Many Thanks to you and the others helping on this very worthy project. All I need now is the full doom WAD.

Regards,

Peter

Re-reading the original post, I think Paul was probably talking about WML, the mobile phone's equivalent of HTML. Good FAQs and a Windows WAP development kit can be downloaded for free, from Nokia's web site, if this interrests you.

Then again, he could have been talking about CSS within an XML context. Since strict XML documents contain no styling tags or attribute (they rely upon CSS for formatting the visual layout and presentation attributes), they can be easily recycled into HTML 4.0 Strict or WML documents, regardless of what is used to display (or even narrate) the information.

What is XML (or WML) plus CSS like?

Imagine a strict version of HTML 2.0 that also supports tables and frames, but never implemented _any_ document, font or table attributes related to the visual presentation (e.g. colour, font name, background colour or images, etc.) added since HTML 3.2.

That's XML.

Now, imagine a second meta document that contains information about how certain types of tags (e.g. h1-h6, em, strong, a href, etc.) and documents/frames/tables backgrounds should look or sound like, which is appended to every document.

That's CSS.

Notice in both cases, I said look _or_ sound like. This is because CSS can also specify audio treatment of those same attributes, such as when interpreting the document through a speach generator for blind people.

Using CSS, although it implies removing visual presentation tags
and attributes (which results in a somewhat lame-looking page
when viewed using CAB or older browsers), is actually a very good
idea, because it accomplishes two goals:

1) provide limitless control over document presentation, through
what _could_ be a single master style sheet, for browsers that
support CSS.

- using a single sheet for a whole site means you can completely
change which colours and background images you use for a whole
site, but never have to alter one single bit of HTML anywhere;
all you do is alter the definitions in your style sheet.

2) on older browsers or HTML parsers that don't support CSS, the
essential parts of the information are still there (e.g. text
and images) but all the visual nicies (background images, font
colours, etc.) are gone (since they are defined in the style
sheet), which results in a faster loading.

CSS is still not supported by CAB or any Atari browser, but this
hopefully will change soon.

Still, I heartfully recommend switching to HTML 4.0 Strict with
CSS right now. While it might not look as cute as HTML 3.2 when
viewed using CAB, it still accomplishes the goal of conveying the
information to the ST users, while under Netscape or Opera it
shines in Technicolor as an added bonus.

Unlkess you're getting Cubase v2 or 3 (or Score) or Calamus (a recent one) as full legal softweare (there are lots of cracks) then that is OTT...no more than a ton tops, and only offer 75....the Ste shouyld only be 40-ish, the monitor about 30, the adapter (unless it's a Link 97) about 20...unless it's a dealer and they're offering a warranty...

Exactly, please see my web pages for details of how I have tried (using only Atari programs of course!) to do this and also a link to a campaign concerned with making web sites viewable by ALL browsers on ALL platforms!

People and firms optimising their site for one or two browsers, and worse of all making it totally impossible for people not using the big two browsers to view their site, should be taken out and shot at dawn - hello Carphone Warehouse et al!

The sad fact is that too many people just don't realise what HTML and the WWW originally set to be. It's not about flashy graphics and huge downloads, it's about imparting news/information/knowledge in a clear and quick way irrespective of what computer system the viewer has.

But like most good things it has been severely trashed by ill-informed and selfish users.

I'm not against progress in developing the WWW, but most of what I see on so-called informative web sites nowadays does nothing but cloud or totally obscure the real content.

;-)

Kind regards

Mike Kerslake

[excellent synopsis about why CSS is a Good Thing]
> CSS is still not supported by CAB or any Atari browser, but this
> hopefully will change soon.

Are there any developments actually in the pipeline yet? I hope so: in some ways this is more important than Javascript, IMHO, especially for authoring pages which are usable by just about anyone using just about any browser/PDA/whatever, especially people with special needs.

I've recently started to experiment with CSS and it is so beautifully simple it reminds me of the neatness of the original HTML concept: so simple just about anyone can learn the basics very quickly, yet very powerful. Promoting backwards compatibility and independence from display format where necessary in an intelligent way means that the important bit (ie content) is accessible to all.

> need to use 16 (T/C) bit colour, AFAIK most web pages use 256 as a max.

GIF images mostly are 256 colour images but if you create them by dithering from 16/24-bit colour using octree palette or similar each GIF will have its own highly optimised palette and look very good. Web browsers running in 256 colour mode discard the optimised palette of good quality GIF pics and apply a nearest colour dither to a standard palette, because each GIF has a very different palette and only 256 colours are allowed! That means a page with lots of nice GIF's will look horrid in 256 colour mode (IMHO!). 16-/24-bit colour certainly looks MUCH nicer...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I had the same problem with a new 1Gig drive. I discovered that the GEMDOS of
TOS 2.06 can not handle partitions with clustersize > 16384.
(I partitioned with AHDI 6.06)
Under MagiC 6 there was no problem.
If you have a single partition on that drive the clustersize could by that large.

Repartion the drive in 2.

That happens because it is waiting to see whether you will do a double click. Geneva tried to minimise this by not inserting that delay in situations where a double click would not result in a different result compared to a single click, but that was only effective in some situations. Maybe MagiC doesn't do that.

To minimise the delay just set the double click rate to the maximum. This means you will have to double click faster though! (I am using a 3-button mouse with double click on the middle button, so that doesn't matter.)

> in there and replaced it with the other drive and then formatted it.

There is no need to format a drive that has no bad sectors. Partitioning
is _always_ sufficient, regardless whether the drive is new or has
already been in use with another machine/platform.

hi all,

I've just been reading about new cut down versions of the web for appliances such as psion's and mobile phones, this is to adapt to their graphical capabilities ,slower connection speeds and so on.

This technology removes any excess graphics etc and provides the user with only the essential information.

Is there anyway perhaps to create a browser for our platform which can take advantage of this new technology? And create a usable genuinely usefull browser, capable of fast effective browsing on an standard ST?

Paul Mc

yes, it was released. I even have here the schematics on A3 paper.
12 pieces with :
Atari Corporation
Schematic Diagram MAXIST
Document numbers C10444x
Date august 14 1992

I promised some people to scan my TT schematics also.
I am working on it.

Any one for the ST Book?

I got a secondhand 0.5 Gb SCSI drive. Put it in the TT.
Worked for a week. Then did not spinup.

Found out: switch on TT, give a few soft friedly knoks with a flat
hand, do a reset. Drive spins up. Do another reset and booting starts.

This works already for 4 month now.

But not with the Falcon. Falcon IDE can be faster than Falcon SCSI,
indeed. This is due to limitations in speed regarding the Falcon's
SCSI/DMA interface.

I'm not absolutely sure about this, but I don't think they (Titan) have much control over the product. Maybe they put up some cash, who knows. The guy that has designed the board is in Sweeden, and has had this idea for some years now.
While were on the subject of vapor ware, I really wish the Eagle would have been released.......A dual 060 machine will be nice to. Centek at least keeps updates coming on their project, but the TOS emulation part scares me. A Milan 060 would be nice, but will it ever find a ticket over here in the US?

No, it's not.

This is only one thing that XML can do. In this particular example, you
are using XHTML (well formed HTML according to the XML standard), and
enhance the display using CSS.

XML is much more, for more details look at www.w3.org, www.xml.com or
(gasp) msdn.microsoft.com/xml.

I remember seeing these many moons ago, try Systems Solutions
(http://www.system-solutions.co.uk) they sell them.
Goto the price list link at the bottom of the page then scroll to section
63. It might be a good idea to confirm that they will work with a ST before
you buy, but as all the other itmes in this section appear to be for the
ST/Falcon it will probably work.

Stephen Moss.

Not forgotten but it takes more time to design a project to be
compatible with all browsers. And if you design a commercial page which
is not primarily aimed at Atari users you'll certainly look at the
market share of the browsers.

> Carphone Warehouse et al!

I don't know Carphone Warehouse. If they have a browser detection which throws out all non-MSIE and non-Netscape users that is really bad. If a page is optimised for a browser it should tell which are the requirements.

At least most people are working on PCs or Macs and alternative browsers like iCab or Amaya have nearly no market share. So they have a PC on their desk and their IE browser. It's quite obvious that they'll design their page to look good on their browser.

> The sad fact is that too many people just don't realise what HTML and the
> WWW originally set to be. It's not about flashy graphics and huge
> downloads, it's about imparting news/information/knowledge in a clear and
> quick way irrespective of what computer system the viewer has.

I think the web needs both sorts of pages: the flashy multimedia ones and the simple information pages. As long as sites like Alta Vista don't start using Shockwave/extensive DHTML I'm quite happy with the current situation.

Greetings,
Matt.

Afraid not for the ST,

You will need a host adapter. I have a Link II but there are others host adapters, mainly earlier ICD models. I run a Syquest 250M cartridge drive off mine. The TT doesn't require one because it also has a true SCSI port.

Cheers

Alyre

> I'd better read the user manual ;-)

Since you have quite an old version of HDDRIVER reading the manual won't help in your case ;-). Media that are at the same time DOS and TOS compatible and thus can be used with DOS/Windows and TOS without any additional software require HDDRIVER 7.1 or later. The current version is 7.8 with the demo version available here:

This is a known bug of HDX.

> Have I screwed the drive up? Should I reformat it under DOS? Any help will
> be greatly appreciated.

No, there's nothing wrong with your drive. It's a HDX bug. I recommend
using another hard disk software.

As far as I know HDDRIVER is the only software that does the trick.
Simply ask ICD support if they also offer this feature.

|info on how to make one for a Mega ST2? Also I would like to install an
|internal harddrive. what would I need to do this? what type of drive
|(scsi,ide or propriety drive)? What cable and mounting?

The connectors are standard US telephone connectors as far as I know
and I presume the cable is as well. System Solutions certainly will
sell you one.

I fitted an internal HD using some sort of Asomething micro device
which converted true SCSI to ASCI (the Atari 'standard') or possibly
to DMA - I think DMA on the Mega. There is a set of pins on the
motherboard anterior to the DMA port which are connected to the
micro device. Again try System Solutions.

In a sense that is the rational for Atari - a plain straightforward
system that allows you to get a good result - no multimedia or other
timewasters.

There are a couple of models around: Golden Image did 2 types, one with
a ball that lit up red or green depending on the function, and one that
didn't.

I have a trackball made by Marconi, this is the first one of this I've
seen. Very robust but I have no info on how to use the middle (third)
button!

If anyone has got a Golden Image one that lights up, I'd be very
interested as it may be easier for me to use.

THe ICD Fast drives have an internal converter to go from ACSI (Atari HD port) to SCSI...If you re-case the converter in a bigger case (like a PC one for instance) then you can add a load more drives, you can even add an external port to add more stuff like scanners...

If you have an old NEC Mulstisync 3D (or similar) that can sync down to 15kHz then you can build a switcher to giver you ST Lo/Med or ST-Hi on a switch, but if you are talking about the 15 UKP things that me and Mario sell then they're purely for ST-Hi on a modern SVGA monitor..

No, it's ACSI, a close approximation but not close enough. You will need a
host adaptor (Link, ICD, Supra etc.) to bridge this port to true SCSI.

* Devpac III
* STOS Maestro Plus (Hardware Sampling cartridge and software included)

List of Compilations :(#4 each game + shipping in pounds sterling)

** (ALL BOXED + MANUALS + ORIGINAL DISKS) **
* Giants
(includes Outrun, Gaunlet II, 1943 and Street Fighter)
* Quatro Sports
(includes BMX, Italia 90, Advanced Ski and Pro Tennis)
* Magnetic Scrolls Collection (1 Meg required)
(includes Fish, Corruption and Guild of Thieves)

List of Games : (#3 each game + shipping in pound sterling)

(ALL BOXED + MANUALS + DISKS)
* Baal
* Batman
* Deja Vu
* Driller
* Elite
* F-19 Stealth Fighter
* Falcon (Game + Mission Disk Vol 1)
* Galdregons Domain
* Ghouls 'n' Ghosts
* Gods
* Gold Rush
* Heimdall (1 Meg)
* Hook (1 Meg recommended)
* King's Quest II
* King's Quest III

* Quadralien
* Leader Board (Game + Tournament Disk Vol 1)
* Leather Goddesses of Phobos
* Lotus Esprit Turbo Challenge 2
* Magic Pockets
* Midnight Resistance
* Midwinter
* Navy Seals
* Night Breed
* Operation Wolf
* Purple Saturn Day
* Premier Manager 2
* Rick Dangerous
* Robinson's Request (1 Meg)
* Shadow of the Beast
* Sly Spy - Secret Agent
* Space Quest II
* Space Quest III
* Spy vs Spy (Artic Antics)
* The Patrician (1 Meg required)
* The Quest for the Time Bird
* Transartica
* Uninvited
* Zool

List of Games : (#2 each game + shipping in pounds sterling)

(NOT BOXED ONLY ORIGINAL DISKS + MANUALS)
* Another World
* King's Quest IV
* Leisure Suit Larry II
* Leisure Suit Larry III
* Operation Stealth
* Police Quest II
* Secret of the Monkey Island
* Storm Master
* Street Fighter II
* The Godfather III (Action Game)
* Wonderland

List of Games : (#1 each game + shipping in pounds sterling)

(NOT BOXED, (1)NO MANUALS, (2)ONLY ORIGINAL DISKS)
(1)Manuals are not really needed to play these games anyway

It locks up under single TOS too. Then all I can do is hit reset.

and for my deal, it's more than a 'bad' connection, not when I can
dial in using just the phone and got the low speed tones all the time.

Plus when they 'Tested' their system, the modems then answer right.

I used to run a BBS, and I know that I had to reset the modem once in
a while, or it wouldn't answer right.

Yes. This really is very unfortunate, but of course much more so for
David and his family than for the rest of us. :-(

>lot of time. The Tempest is being developed by Istari for Coretex AFAIK,

That's right. I'm pretty sure it would have existed by now if it
hadn't been for David's family troubles.
As it is, the design is still being tweaked.

>which is how the Eclipse was done...I've got an Eclipse and I love

If this CAD program is using lots of poly-lines (as opposed to only
drawing one line at a time (it's still the same VDI function)), or
especially filled polygons, I hope you're using the latest versions
of fVDI and the RageII driver.
Polylines can easily be more than twice as fast as before and for complex
filled polygons there's just no comparison (the latest RageII driver
uses the mach64 hardware support for polygon fills, which means that the
individual lines can be drawn off-screen into a monochrome buffer using
hardware acceleration and a special blit mode is then used to put this
on the screen).
Oh, and the Bezier curves and areas are also working fine. ;-)

Message-ID: <382B670F.146DF9E5@bellsouth.net>
Source record: 70785

Hi all,

I recently downloaded Cecile from the centek website. This allows you to format and partuition your HDusing a gem based menu (part in French). I recently traded a 3.5 inch 2 gig drive from my pc for a 2 gig 2.5 inch drive for my F030. I tried to partition the drive with AHDI, and it told me I needed to format the drive, so i formated it and then AHDI told me that the root sector was corrupt. I then downloaded HD Driver demo and this did a fine job of telling me about all it's features, but I still needed to get the drive straightened out and couldn't wait for a few days to find out how to buy the program. This isn'r CRippleware this is HANDICAPWARE, and because of that HDDriver lost a customer. Anyway, I found this program called Cecile on Centeks site. It allowed me to format and partition the drive with no problem. I now have an internal 2.1 gig drive in the F030 with a 32 meg partition for botup and 2 1 gig partitions. Has anyone used this program, and how safe is the data.

Also, I have an extra 1.3 gig 2.5 inch drive. What is this drive worth, and if anyone want's it, send me an offer.

Hi,

I read an article about using some sort of intercooler to boost a 400mhz p2 to 800mhz. The product is basically a refrigerator that you place on top of the chip. Could a similiar setup be used to boost the speed of my F030.

2070. Re: 3.5 ide on falcon

Newsgroup: comp.sys.atari.st
Date: 1999-11-11 00:00:00 UTC
From: Bill Platt <virtb@bellsouth.net>
Message-ID: <382B6975.4DFA5D0@bellsouth.net>
Source record: 70787

Hi,

I traded the 3.5 for a 2.5 drive of the same capacity. My friend needed a new HD for his desktop, and I just replaced the 2 gig off my pc with a 17 gig. I wanted to put the 2 gig in the Falcon. My friend wanted to put the 2 gig 2.5 in his desktop. Instead of each of us buying adapter cables, we simply swapped drives and save a bunch of money.

You can send any contributions to my email address: mb@gem.win.co.nz .

We will endevour to send copies of the magazine (to be published in early December) to all contributors.

The deadline is a bit close as we need all contributions well before the end of November (this month). But either way we will be grateful for everything we receive.

Steve,
Thanks for the reply..
I'm using ICD's drivers. I have also tried CMHD(??) and the HD Driver
Demo, no luck with them. I have been booting the system off a floppy
with NO ACC's and only the Driver for the hard drive as an auto program.

The drive is a Maxtor 7245SR made in '93 if that helps put some more
light on the subject.

And I'm in the USA.. Massachusetts.

Thanks Again,
Rob

2076. Tempest

Newsgroup: comp.sys.atari.st
Date: 1999-11-11 00:00:00 UTC
From: Joshua Kaijankoski <joshuak@isys.ca>
Message-ID: <s2juf515hsq11@corp.supernews.com>
Source record: 70830

Does anyone know anything about Tempest? Has Cortex Design released it allready? Their web-page was last updated on July so I don't know what's going on... Is Eclipse out yet? Sounds like a great piece of hardware. Finally we're getting somewhere. Power PC is the way to go. I hope they're still in business.

Joshua.

2077. Re: Atari Falcon+Centurbo II vs 366 Celeron PC

Newsgroup: comp.sys.atari.st

From: Joshua Kaijankoski <joshuak@isys.ca>
Message-ID: <s2jun75rhsq85@corp.supernews.com>
Source record: 70831

I have decided now. After hours of research and comparisons between different accelerators I have come to a solution and it is: Falcon + Tempest + Eclipse all in the MK-X case. I can get this all from Cortex Design. All I have to do is wait for them to release Tempest. This setup would be super fast and would compare with the fastest Pentiums around. I hope... Anyway, sounds really good. Now, if only we start getting some PPC native programs :) How 'bout it? What do you think of the setup?

Joshua.

I still look forward to the Tempest, and I
still debate on wiether there will be a Milan or
a Tempest Falcon in my future.

Honestly, I think the Tempest was given so
much early hype that that Core Designs is trying
to live up to the hype and not release it until
it is flawless. ;)

We might be waiting a while.

2085. Modifying a Mitsumi floppy drive

Newsgroup: comp.sys.atari.st
Date: 1999-11-11 00:00:00 UTC
From: Alyre Chiasson <epinoche@nbnet.nb.ca>
Message-ID: <382A1A4E.4798ADEA@nbnet.nb.ca>
Source record: 70839

I have in the past been able to modify the Mitsumi D359T6 but am
currently
struggling with the D359T3. The first thing I did was to short the media
change
pin. The T3 model has a series of 2 rows of six pins
next to the power plug which I assume sets the ID. I have tried removing
them all with no luck. The drive
doesn't even light up. I haven't connected the HD pin to pin 2 as I was
wondering if that was necessary if it is to be used as a 720K drive. To
the side of what I think is the ID jumpers, there is a diagram that
looks like this:

2 0

1

The outline resembles the letter "T". However, I am not sure whether it
represents the ID and jumper settings to start with, or how to read it.
I have turned the connector cable around so the pin 1 on the ribbon
cable is matched to pin one on the drive. Everything would seem to be in
order but I am not sure about the drive ID. I can't find a site on the
web which gives the settings.

Any ideas?

Thanks

Alyre Chiasson

How old is the internal hard drive? kind of sounds like a slight case of stickon, and that can only get worst. Or there's a fryed wire someplace for power. Heck there's a whole drive full of things that could go. My 500 meger just up and craped out one day, I was lucky to just have gotten this 2.1 gi drive the day before.

I got this 2.1 drive from the online auction Haggle.com, with shipping it cost me $25.00, not to bad.

This is exactly what I'm *hoping* to do. I've got an MK-X case (which
looks nice and has lots of room inside), and am just waiting to hear
from Titan/Cortex as they haven't returned any of the three e-mails
I've sent them over the last couple months asking about Tempest's
status. Anyway, here's to hoping!

Don't know about the newer ST's but the older ones certainly will as they use an autosensing 220/110v 50/60hz power supply,I still have my original British 520stfm working here in Vancouver,BC,Canada and it works fine with both colour and mono US monitors.

I've had something like that occur up here as well. If the dial
counter gets past 30 seconds, I usually just abort, lift the phone off
the hook, and begin the dial again. Weird stuff.
Other things that are blamed on TOS; Late at night, my setup screams,
no disconnects (unless there is some automatic server stuff going on).
During peak hours, things really slow down, and at times a connection
cannot be maintained. I don't think it is a TOS ware problem, only to
the extent that our software doesn't keep pinging the hell out of the
server to let it know we are still connected. One problem I noticed is
if Newsie is running, and a connection is lost, sometimes the system
will hang (Under MiNT). I usually just get pissed and log on at a
later time, not being the adventours type. Last time I decided to
upgrade and fine tune my setup, I lost the whole works with one
mistake :) I have setup to ping the newsserver while I type (this is
about a three minute reply here) so I don't get disconnected, but I
only ping my ISP, which doesn't have its own server. They use
supernews or remark.q, which both suck big time.

Hi Alyre

I too am struggling with this drive at the moment, I have contacted Mitsumi Support but surprise, surprise I havent had an answer yet.

You mentioned in your post that you shorted the media change pin - excuse my lack of knowledge why? and how?

I want to use the drive as an external high density drive for my TT030.

I have spent a number of hours messing with jumper setting on this drive - and no luck so far.

How did you modify the D359T6 I have changed the jumpers on this model the drive is seen and the light comes on with disk access but it will not read any disks - always get an error.

I would also appreciate any help in getting these drives

2093. MagiX 6.1 and Kobold 2.5

Newsgroup: comp.sys.atari.st
Date: 1999-11-12 00:00:00 UTC
From: Paul Matthews <paul_matthews@yahoo.com>
Message-ID: <80gmfrccl1@nnrp1.deja.com>
Source record: 70697

Hi

I am using the UK version MagiX 6.1, NVDI 5 and Kobold 2.5, everything works fine except that I cannot get Kobold to take over copying etc. I have entered the Kobold ENV statement, copied Kobold to all different directories etc - MagiX just says Kobold is not installed. It will work if it is installed as an accesory. I prefer not to load it this way.

What is it with the MagiX 6 you get a version 4 manual and a text file that tells you bugger all. What are the main differences between the versions 5 & 6.1. Does ASH have an English version of its website?

Any ideas would be appreciated.

Even with a host adapter you will never get a full features SCSI bus
like you have with TT and Falcon. But nevertheless you get quite near.
Note that the LINK97 results in the highest possible SCSI compatibility
since it's the only host adapter that supports initiator identification.

A quick look at the README file would have told you. BTW, the demo
version can't partition your drive anyway since its features are
limited. This is also mentioned in the README file.

> isn'r CRippleware this is HANDICAPWARE, and because of that HDDriver

It's a limited demo version and that's what it says. Nothing unusual
here.

2098. Ultimate Virus Killer 2000 (Atari ST, TT, Falcon platform)

Newsgroup: comp.sys.atari.st
Date: 1999-11-12 00:00:00 UTC
From: Richard Karsmakers <richard@fortysecond.net>
Message-ID: <6+ArOFScc7d5VQFAHRc=liDyVawH@4ax.com>
Source record: 70702
Cross-posted to: alt.comp.virus,comp.sys.atari.st,hacktic.virus

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for well over a decade, and with the latest release (8.1) it's turned shareware.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://uvk.atari.org.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me at cronos@atari.org and I will refrain from posting to the newgroup in the future.
Thanks for your time.

2099. ST News International Christmas Coding Convention 2000 (Atari ST scene)

Source record: 70703
Cross-posted to: alt.demogroups,alt.anybody,alt.www.sites,comp.sys.atari.st,alt.crews.atari

Are you a member of the former Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990?

Then you should not wait a second longer and surf over to http://stniccc2000.atari.org to discover that, in fact, a reunion of that very historical event is being organised for December 2000, a 10th anniversary reunion as it were! It is going to be the coolest event of the millenium, I can assure you!
In case you've already surfed over to that site in the past year or so, be advised to check it out again, as it's been overhauled utterly! It looks way cooler now, and contains a lot more information!

B> isn'r CRippleware this is HANDICAPWARE, and because of that HDDriver
B> lost a customer. Anyway, I found this program called Cecile on Centeks

HDDriver is commercial software, not shareware, so what did you expect?

If you need a free driver, I would recommend using CBHD - that has the
SCSI driver interface, XHDI support etc., which I believe Cecile lacks.

B> site. It allowed me to format and partition the drive with no problem.
B> I now have an internal 2.1 gig drive in the F030 with a 32 meg partition
B> for botup and 2 1 gig partitions. Has anyone used this program, and how
B> safe is the data.

Be sure to keep the partition size *below* 1024K - TOS 4 can't handle
partitions with 64k clusters. It seems to work, but you get corrupted
data or other strange effects (basically, only Gemdos' Fseek fails).

```
>>>>> "D" == Derek Warren <macgod@rocketmail.com> writes:

D> Does the term 'FastRAM' (as opposed to ST RAM) refer to a chunk of
D> memory used for non-legacy ST applications?

Fastram is memory that can not be accessed by the Video controller
andï¿½r other onboard hardware - it may be that only the CPU can access
it, or CPU+DMA (as in the Falcon). A good fastram card for the Falcon
will give twice the memory throughput than ST-RAM.

D> * chro_Magic's Falcon RAM Gizmo (takes 30-pin SIMMs)
D> * the 'Falcon RAM Karte' at Systems For Tomorrow (takes 72-pin SIMMs)
D> * Wizztronics' RAM upgrade (takes 72-pin EDO SIMMs)

I don't know these. If they consist only of a card with a SIMM socket,
and do not needany drivers, then they are ST-RAM.

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

(Update: 11/04/99) I've just added a bunch of Titles to my Atari 8 Bit SoftWare Catalogs. All Games!!! A number of them are UnOpened! Many for only $5 a pop! And I went through my Catalog and did some adjusting of prices. Right now my 8 Bit SoftWare Catalog has a bigger Byte count than ever.

Atarians Unite! Are you pining for the days of a simpler Computer? Do you miss Arcade Classics like Asteroids, BattleZone, Joust, Missile Command, Robotron 2084 and my favourite Star Raiders! Well Bravo Sierra Computers has them. Are you wandering, wandering in the desert of violent video games. Games too violent for children? With Blood & gore? Two companions of youth nowadays. Especially those you hear about in the news who kill fellow students at school. If your preferences for games lean more towards family friendly. Like it used to be. Try some of my Atari Arcade classics. I have oodles of Atari SoftWare! As well as truckloads of Atari HardWare. And Libraries of Atari Books. Reference material and things you thought you'd never find! So come check it out. The best of Classic Atari 8 Bit & Atari ST. E-Mail me at

e-mail: atari@benjamin.net

Or call me anytime at (503)256-9974 to talk to a warm, friendly, people person! Your more likely to reach me from 3 PM-3 AM Pacific Standard time. And thats most likely the times I can return calls. I'm perfectly willing to call you, on my own dime to answer your questions. I'm a people person and those who have dealt with me will find me patient, a good listener and even a good teacher. So if you can't call me Today? Call me Tonight!

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact check it regularly as my Catalogs are updated regularly. I have 6 different Catalogs, and my SoftWare Catalogs are my largest. They have the biggest Byte Count. And remember if you can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity,
you are cordially invited to attend a Meeting of the Portland Atari
Club. You don't have to be a member to attend. Now we've moved our
meeting to a new night. Same Bat Time! Same Bat Channel! We meet the
2nd Thursday of each Month. Our Next meeting will be Thursday, December
9th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland,
Oregon. Get together with other Atarians. Make friends, meet new
people, maybe find an old friend. Eat Pizza, drink Pop & Beer in a
decorative atmosphere. Bring your family to a family friendly place.

Hi could someone please convert this file for me?

http://www.beer.tj/sonnenrad.cdk

It was written with Calamus on an Atari St and I can't read it. And
the Calamus demo doesn't run on WIn98 (I couldn't save with that
version either..)

Could you please send the converted file to me? preferraby Word or
PDF, at least something I can read with my PC.
My email is elmar@beer.tj

Thanks alot !!!!!!!

2106. Falcon ROM question

Newsgroup: comp.sys.atari.st
Date: 1999-11-12 00:00:00 UTC
From: Paul Flieshman <MUB046@news.salford.ac.uk>
Message-ID: <382C0E95.507B0A64@news.salford.ac.uk>
Source record: 70710

Hi all. I am currently rebuilding a heavily modified Falcon, and I have
a bit of a problem. It is originally a German machine...so TOS is in
German.
Hmmmm. I can read a bit of German, but obviously I would prefer to be
able to change it to English. My instinct says that I probably would
have to change the ROM
for an English one. Does anybody know better, or have a better solution.
Or even a knackered Falcon with an English ROM?
Cheers,
Paul Flieshman

Hang in there for a while. Mitsumi is going to fax me the jumper
settings for the floppy drive, hopefully today. It would be more
informative if I emailed you after I am sure I have the drive set to 0
and tried a few other things. Hopefully, I will have it working.

> Or even a knackered Falcon with an English ROM?

good news!

you won't have to change the ROM, as the Falcon was designed with an
NVRAM scheme which actually has available to it a number of languages
including English! All you need is a program that will allow you to access
the ROM and change your language. Be careful though, as fooling around
with certain settings could lock up the Falcon.

I believe Uwe Seimet did a program a few years ago which allowed you to
do this.

2109. SVGA switchbox?

Newsgroup: comp.sys.atari.st
Date: 1999-11-12 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-1211990838100001@ts7-43t-17.idirect.com>
Source record: 70713

In bringing my Falcon back into my desktop to run as well as my Mac Quadra 950, I want to use the same monitor with it (an LGE 520si). I know a switchbox would be useful for this.

However, I picked up a switchbox a few days ago and found to my chagrin that it blurred the output of the screen in the higher resolution modes on both machines (works fine in low res and 640x400 mode on the Falcon, and both work great when plugged directly into the monitor)

And when I decided to open the switchbox to see if there was anything wrong, I noticed that the screws were magnetized. NOT a good sign?

Can anyone who has done this sort of thing recommend a good hardware switch box that won't do this?

JI> Mega ST, Mega STE and TT keyboards are all interchangable.

They may be interchangeable, but they are not the same quality. The
MegaST one uses single gold-plated contacts made by Cherry (like the
G80 PC keyboards), while the MegaSTE keyboard is a cheapo foil-contact
type, which tends to break and is difficult to repair.

I definitely know why I prefer the ST version.

The Falcon ROM supports several languages right from the start. You can
change the language and the keyboard layout with tools like BOOTCONF:

2119. challenge for Atari programmers - Sherlock clone

Newsgroup: comp.sys.atari.st
Date: 1999-11-12 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-1211991259420001@ts7-62t-2.idirect.com>
Source record: 70723

as you probably know, Apple is making a big thing about their desktop search engine called Sherlock (Sherlock II in the new OS9) which allows you to do actual searches on the Internet by sending the proper commands to online search services like Yahoo, AltaVista, etc. By doing it this way it speeds up the process.

well, how about Atari programmers coming up with a similar program for use with STing?

And I think I found an approach to do it. Someone on the net has come up with a program for older Macs called Lestrade which works alongside your existing webbrowser. Just feed in the topic, choose the search engine you wish to access, and Lestrade calls up the web browser and feeds the necessary string to it. I'm using it alongside iCAB on my Quadra and it works great.

I would figure that this shouldn't be too hard to do under an AV enviroment. So how about it?

No the power suppies are auto switching which means that they sense the input voltage and then switch over to that voltage,a lot of older IBM clones and monitors had a switch on the back which you could flip between 110 and 220,the Atari did this same thing but automatically. I guess by using a relay to change the tap position on the secondary windings of the ps transformer.

It's the same thing when you post your hardware for sale. Alot, not
all, people think that becasue it is "old" Atari hardware, that it is
only worth thrift shop prices, or you should just send it free.....
If they want it, they can pay for it. Otherwise they can whine and go
without. The above guy wants Norton Utilites for free, and can
probably get it in the PC/Mac market...... There is always AHDI and
Tools to work with.

Greetings all..

I have several Jaz drives that are Atari formatted that I need to get the data out of. I haven't sold my Falcon yet, so I COULD go through the trouble of setting it up, finding a copy of HDDriver, and copying them across to a new drive.. but I was hoping to avoid that.

The question is, is there a Mac or Win program that will allow me to read these cartridges directly? I believe MagicMac will work.. true? Anything for the PC? Anything inexpensive?

Does anyone have a used and unneeded version of whatever software that will work they'll sell to me?

Thanks for the help.. these are very valuable songs I need to get off the jaz drives!

-Mark

ICD makes (made) program's which not only change the desktop language
but also sets the country the keyboard was made in (important so a keypress
will enter what is printed on the key itself; different configs).

My two cents,
As far as I understand, Atari did NOT fold because of competition
but because there were internal problems related to the Tremiels who
owned Atari!

2136. TT/Falcon FastRAM?

Newsgroup: comp.sys.atari.st
Date: 1999-11-12 00:00:00 UTC
From: Derek Warren <macgod@rocketmail.com>
Message-ID: <111119991717157811%macgod@rocketmail.com>
Source record: 70792

I'm a little unclear about FastRAM and ST-RAM.. as well as RAM upgrades
that use 30-pin SIMMs vs. 72-pin SIMMs vs. 72-pin EDO RAM..

Does the term 'FastRAM' (as opposed to ST RAM) refer to a chunk of
memory used for non-legacy ST applications?

i.e., are all Falcon RAM upgrades considered 'FastRAM' upgrades? I'm
looking at the following products..

* chro_Magic's Falcon RAM Gizmo (takes 30-pin SIMMs)
* the 'Falcon RAM Karte' at Systems For Tomorrow (takes 72-pin SIMMs)
* Wizztronics' RAM upgrade (takes 72-pin EDO SIMMs)

Fast, faster and fastest... can they all considered FastRAM upgrades?

Derek

TORONTO ATARI FEDERATION FLEA MARKET NOVEMBER 17TH!

Yes, folks, it's time once again for users of the classic Atari 8-bit, ST, TT and Falcon computers to come to the annual event where you can divest yourself of what you don't need while at the same time hunt out for what you do! Sell your old stuff, discover a treasure!

Among other things you'll find at this event:

classic systems! Looking for that Falcon? Wished you had an STe and its expanded capabilities? Do you need a 600XL for your collection? There's a good chance you'll find it here!

hard-to-find games, peripherals, literature and applications!

TAF Software Library, carrying hundreds of PD/Shareware games, utilities applications, as well as the TAF Internet discs! Plus we'll be selling 720K floppy disks, stock up! The membership desk will also be up for renewals as well as new members.

the camaraderie of fellow Atari users - swap stories, troubleshoot, ask for advice! Meet some of the faces you've only read online on the Internet!

Ken Macdonald's demonstrations and sales of the various Mario Becroft adaptors for Ataris. Use a PC three-button mouse with the Mouse Adaptor, plug & play, works with Ataris and Amigas! Use a PC keyboard, PC mouse and Atari joystick with the amazing new QwertyX adaptor, no soldering required! Give your ST or STe amazing storage capacity with the Internal IDE Adaptor kit - program storage, add a CD-ROM, use an LS-120 internal drive to replace your disk drive! And, with the VGA Adaptor, use any VGA or SVGA PC monitor with your Atari ST to get a beautiful hi-res display!

All this and MORE!

It's a night of fun and commerce, and it's being brought on by the one, the only, Toronto Atari Federation - bringing you the best in Atari-related computer info and enjoyment since 1984! See you there!

Flea Market details:

Admission and tables for TAF members: Free
Admission for non-members - $2.00 (one thin toonie)
Tables for non-members - $5.00 (admission waived if you purchase a table.

NO STOLEN ITEMS OR PIRATED SOFTWARE ALLOWED! VIOLATORS WILL BE PROSECUTED TO THE FULL EXTENT OF THE LAW. (No matter how much The iDiot Forever Known As Sinclap will bitch and whine, fast or slow, the law's the law!)

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

It is very much possible, but the caution abide!

I remmber years ago in a CPM magazine, that someone had the ULTIMATE Kaypro speed-up. They had an un-used AT controlling a liquid Nitrogen setup, that cooled the CPU of the Kaypro. This made it run about 30 X faster!

2141. For sale! ST Altered Beast with box/manual! Like new! $25 shipped!

Newsgroup: comp.sys.atari.st
Date: 1999-11-13 00:00:00 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <80jf69kir1@nnrp03.primenet.com>
Source record: 70647

I would rate this ER, from my experience extensively shopping for ST games for 5 years. This is rare! I think 25 shipped is fair, since it is so hard to find (on the ST). There is slight box wear on a corner or two, but all looks very nice, and disks look absolutely mint!

If interested, e-mail me. If nobody does, I will put it on Ebay, and maybe even get more if I'm lucky. Must have payment first before I ship. Check my feedback rating on Ebay under "Satcom2" and you will rest assured.
Thanks! -Satcom2

Time has come to part with the past ... I have two Atari Mega-4 STE's,
one with monochrome monitor, the other with both colour and monochrome
(with switchbox). Also, **YEARS** worth of software collecting -
everything from shareware and public domain to commercial packages.
(Full version of PAGESTREAM, CALAMUS, ... others too many
to mention. There is also a variety of add on hardware that includes
(if my memory serves me right) a video still capture card and a
audio capture card.
I have moved on to other things, and my kids do not have an interest
in this collection of ATARI history ... **sigh****
This is all free to anyone who can come pick it up... Located in
the heart of southwestern Ontario (Canada) -
If anyone is interested, send me an e-mail to arrange details... I hope
someone can use this ... it would break my heart to send it to landfill...

If I remember my scsi... Yes it is terminated. The 2 sets of "pins" are
installed.

I've played around with the jumpers, trying every combination I can
think of. The HD has 2 set's of jumpers, one set with 5 pairs the other
with 4.

Lost me on this part Steve.. I'm already booting off a floppy with the
icd drivers on it. Isn't that sort of what you are suggesting by
bypassing the hd boot?

And You're right... I'm not in the mood for a ride over the pond to
your house <G>.

Goto www.emulators.com and look for Gemulator Explorer.
Reads Atari and Apple disks on a PC. Freeware, restricted
to copying one file at a time. They also have a commercial version
under an other name that again comes free with one of the
Gemulator packages.

No. Cooling doesn't boost the speed. It's used to keep
a chip *stable* and prevent it melting when clocked with
a higher frequency. Boosting the CPU speed has little
effect unless you have some kind of fast off-chip
memory to act as a buffer between the accelerated CPU
and slower main system bus.

Hello,

I found a Atari Mega ST4, with keyboard, mouse, and a mono monitor at the salvation army for only $20, and I bought it. I use to have an old 800 XL and had always wanted an ST. Funny I even bought it now that I'm writing on this 366 MHZ machine.

Anyway, it didn't come with any software. Where can I get some?

2167. FS: Atari Megafile 30

Newsgroup: comp.sys.atari.st
Date: 1999-11-13 00:00:00 UTC
From: Josh Payne <jeNO-SPAMpayne@swNO-SPAMbell.net>
Message-ID: <nanX3.3471$B_1.144589@typhoon01.swbell.net>
Source record: 70673
Cross-posted to: comp.sys.atari,comp.sys.atari.8bit,comp.sys.atari.st

Hi folks... I've recently acquired an Atari Megafile 30 hard drive unit without cables or manuals in a bunch of vintage computers and was wondering if anyone would be interested in purchasing it...

I don't know what its operational condition is but it appears to be in good physical condition, so if anyone's interested you can make me an offer. I don't know what to suggest as far as what would be an acceptable price as I am unfamiliar with Atari computers, but I'm sure someone would like to give this a good home.

To be perfectly honest, I really wanted an Atari computer when I was growing up but Dad bought me a Commodore... But we didn't have hard drives (hee hee). But from time to time I run into some Atari hardware and have always been able to find folks who know what to do with it.

If you're interested, please reply via e-mail to this message, removing the obvious spam-prevention.

Thanks!
JP

Do any of your other programs work? It sounds like it's having a hard time resolving the addresses. I did notice one thing fairly odd in your header. It seems that where ever you are connecting from it's routing you to a Squid server in germany. A pretty strange hop if you are in the UK.

It's just personal with me and Squid. I hate it. I'll update my web page and it will take squid several days sometimes before I can get my current edit. I frankly consider that to place it in the range of non working.

I played around with several mouse and track
ball solutions, but the best track ball
surprisingly was the ATARI trackball/roller ball
that was made. Seems like Best Electronics sells
one that is modified so that the buttons are on
the bottom rather than the top. The most
responsive track ball I've yet to use!

Doctor Clu

(And a great controller when playing "Battle
of Britian" by Lucas film on the Atari TT....)
(Drool....)

Hello Sean,
I'm the translator of the french part of this website
Jan Frederick told me that he was currently busy working for his studies...
So he hasn't updated the pages for a month now :-(
Try for the moment http://www.atari-world.com , http://www.atari.org or
MagiC Online for atari news

Probably because Ataris never has been a success in networked
office-situations, so nobody has seen the need for it. Besides, it's
extremely tricky to implement, because neither the AES nor the VDI is
designed to do it.

The STiNG version looks for micq.rc. I haven't tried the new STiNG version
yet but the older STiNG worked rather good on my system.

Yep, I shaw it also. It was still in very primitive state but it looks
promishing indeed. The feature that I really liked was that one could
resize the browser window realtime. If one do this with Cab for instance
it will reload the page again which takes time (and money). That new
browser doesn't do that at all. Nice very nice indeed.
According to the programmer it will work on all system and not just on one
particular system, which alas can't be said of certain other new prg's.

Hmm, the MiNT version of Micq 0.4.3 works much better then the previous
version. I really can't recommend the previous version.
I've used the older STiNG version for a while and I must say I had some
serious problems with it. I'm glad I can use now the new MiNT version.
It's stable as a rock.

Hi Al,

nope, there ain't such a thing for Atari. PC-Anywhere allows you to
log in on a remote computer, in fact you're getting the screen of your
remote machine on the local one, so you work direct on the remote. The
remote itself can still be operated by a local user (if you see the
remote one doing weird things...)

It's a pretty funny sight, looking at a PC remotely controlled by
someone else, watching the mouse flying around and opening dirs etc.

Source record: 70602

Possibly the LARGEST site is at UMICH.

http://www.umich.edu/~archive/atari

The files are getting dated as the ftp portion hasn't worked since march.

However there is alot of software and it will work on the mega.

It is a good start.

I would also recommend Hallvards Launchpad which can be found off
Atari.org, which is also a good place to start:-).

The Belgian Ftp site has more modern and current apps. It posts its URL
here often with the latest uploads.

Remember at the umich ftp site to get the starter tos which provides the
most common needed archivers.

Zips and LZH can be opened by MS based software.

Format disks on Pentium to 720k and your mega will read it.
It doesn't always work the other way around.

There are utilities which allow you to format from an ST to a compatible
format that the PC can read.

Later STs format the same.

This is just a start and you should get a fair amount of replies.

later Brian.

I wouldnt recommend you to install it yourself, its tricky (the say the least). Better to let centek do the installation for you (if they still have boards).

Most of the ct2 owners I know have problems, some of them soo serious they can use their falcon the way they used to.
My ct2 was installed by centek, i have 4mb stram and 16mb ttram and i have no problems with it. Well.. not entirely true since the dsp-irq is wired, and that does of coz make some programs crash.

I mostly use my falcon for asm coding and demo watching and i am VERY happy with my ct2. I can really recommend the ct2 to you, but let centek install it.

/Fredrik Egeberg

Yes the Ram Karte Memory board which uses a single 72 pin does
work fine with the CT2 v.B. Its the board I'm currently using now.

Anyone know if the Eclipse and Temptest will ever make it to the USA?

I didn't know that the Eclipse was even available to I read that a few folks have it now. Is Titan/Core or whatever they are now called the only place to purchase a Eclipse or will I have to get out the tele-scope with the Moon viewer to ever see one?

as a matter of fact it does - when plugged directly into the Falcon or
the Mac it's great, in fact stunning :)

I tried plugging just one computer through the box and again it began
to blur in higher resolutions.

>

I just thought that it was very strange that the screws were magnetized
and they stuck to the screwdriver. Hopefully the switchbox isn't
magnetized too - could that do it?

you can use a standard external modem with your Mega, just make sure
that you don't get one designated as a Windoze modem - I had trouble with
my GVC WinModem when I first got it, thankfully GVC was kind enough to do
a straight swap for a Mac model that has worked great since. Also realize
that you'll be limited to 14.4 unless you do a mod to your modem port.

Ken, TAF's president, has been touting using NEWsie alongside STing for
those members of the club who have one meg no hard drive machines, it can
handle e-mail, USEnet, FTP and even text-based web surfing.

your machine is not affected by that, it came before the bad batch of
STes. You CAN upgrade to an internal IDE drive using Mario Becroft's
board....

>it. I found this newsgroup and was very surprised about the traffic in this
>group. It rekindled an old fire in me ;-) .

You were surprised so was I. After 7 years away from Atari, I now find myself with a horde of 520STs, 1040STe, Mega2, TT and a Falcon. Lots of friendly/helpful people and still software being developed.

>-> Can anybody tell me, what possibilities I have with my old Atari,

>with serial cable? With kind of Software do I need (only E-Mail would be
>OK)? Is it possible at all without a Harddrive, only with 720k Floppy drive?

Yes, Here is what you can do with a floppy drive system and 1meg.

The Program STing will give you your TCP-IP connection/dialer for the internet.

You need a modem and serial cable. You ST will only operate at 19200 without a modification, however that is plenty for NEWS and Email

NEWsie will give you your EMAIL and NEWSGROUPS and FTP ability. Works with 1 meg. Also it can grab a Web Page.

You also need the program

HS MODEM in order to allow you ST to operate at High Speed without corruption.
HS modem provides a number of programs for the different STs
Your would require
DRIVEN
MFP
SCC I believe placed in the autofolder.

I have used this setup on a floppy, heck I even used the Web Browser CAB1.5 on a floppy when I first pulled my ST out of the closet as you have done.

>
>* can I connect the Atary with my DOS/ Win PC?

Yes you can, many different ways.

>* In 25th Oct. John Kolak wrote, some STE have defective DMA chip that
>scrambles the hard drive. Could that be the reason for the problems I had
>with my Mega ST?

NO, it couldn't. I have an STe from 1989 that does this. The problem is that the early STes (Mine being made in Mexico) used the STs (Gees can't remember the chip name atm) but anyways these chips were to be different in the STe than what was used in the ST.

The DMA access of the STe was corrupting the data. There were only a few months of production like these and since many ST users never had a hd many of the STes with the problem never got corrected.

I would suggest you pick up a cheap scsi, these can even be found for free and put it in your case. Then buy HD Driver or Download cbhd.

Hope this helps.

in the above, you claimed that the Athlon wouldn't run Windows. Now you
claim it does. Already changing your story?
>
> BTW...I use a real newsbrowser do you?

MT Newswatcher on the Mac, NEWsie on the Atari. DejaNews is designed for
those who want to learn USEnet, but many people who use it move on to real
newsreaders for the advanced features. Why is TiFKAS still content to use
training wheels when he constantly brays loud and long about the
"superior" Mac Internet tools?
>

>
> Your problem...not mine...

no, your problem. You seem to have a problem with backing up your
statements with fact, and that's why we suspect you're posing as an "Apple
Power Rep". And you have hissy fits when anyone asks you for collaboration
of your employment...

> > >eh? instructions for 'Chunks' once todler tricycle(sp?)...

>
> Just fine here...You? Have you been on date recently?

according to TiFKAS, my celebacy (my own choice) is supposed to mean
there's something wrong with me. According to his yardstick, then, the
Dalai Lama is a wimp - which he most certainly is not.

Please note, that when backed in a corner, TiFKAS will try to dodge the
question by bragging about his alleged job, his alleged stock, and his
alleged prowess as a "macho stud".

>
> > BTW, it's spelled "toddler". Something that you are an expert in acting
> > like. More strained spinach, Cartman?
>
> spEaking duetch here?

speaking plain English. And spelling plain English. Too bad you can't
comprehend plain English, toddler. Would you like salt on your crow?
>
> > >just sinclap
> >
> > just a clueless troll who can't spell, can't give a cohesive
argument, and
> > has hissy fits when nobody will let him use USENet as a catbox....
>
> Many grate peeple culd nut spill....

But Apple Power Reps are supposed to have mastery in comprehension and
spelling. Something TiFKAS lacks, which makes his claims of employment
extremely suspect. It's all in the Apple employment requirements on their
web site.
>
> > **********Daniel L. Dreibelbis**********
> > Vice-President, Toronto Atari Federation (TAF)
> ** -still an underachiever...

not to my friends. not to my boss. not to my family. only to that
pathetic loser TiFKAS, whose opinions are only a fart in the wind, and is
a disgrace to his family, whose boss probably chews him out over every
little mistake, and has no friends, which explains his constant attacks on
innocent people on Atari-related newsgroups to try to bolster his flaccid
little ego....

> -afraid of Ken

now why should I be afraid of Ken, who I consider my dear friend as
well as my partner in successfully keeping an Atari user group viable. Do
I sense that you're extremely afraid and jealous of us, LOSER?

> -chicken sh t

my my my. Coming from the biggest BSing LOSER of all - seems I'm
pushing some buttons here and succeeding. And besides, that's hardly
professional language for someone claiming to be an "Apple Power Rep". Why
I bet if your boss caught you using that sort of language in front of a
customer you disagreed with, it'll be
searching-trash-cans-for-half-empty-bottles-of-MD-20/20 time. That is, if
you even HAVE a job, LOSER....

Source record: 70619

Hi Jo,
Yes indeed,
The thing is that the ct2 degraded step by step.

I started to have weird crashes after months of good working conditions.
Then the fan glued on the ct2 cpu stoped spinning, (so now I have to
manually start it).
The audio problems weren't noticable at the time (didn't test extensively
this area at the time), You know, 100% compatible, scsi bug gone (as they
say). (when originally my falcon was patched correctly, and cubase audio
used to work perfect, as I was even able to finish my songs.).
Not anymore, this is a falcon right now, music less. (well plays wav files
and play/record MIDI),. but not serious at all for me.
I am glad you take this in a fun way. It ain't funny to me.
I have a falcon, have to finish some songs, I can't play around with
centek deaf/insulting attitude anymore, don't have time and patience
anymore. You can spit on me many times, i will never really bite you back,
I just get tired. I flushed 50 bucks on an FPU chips right down the
toilets, that aggraved me also.

Well guess what I have to do? is to use this pc to finish my songs,
At least no more crash and cracks and pop from the falcon, and that is
very good for my singer and guitarist.
Which were mocking the atari falcon.
To them atari = piece of joke (many good laughs about it)
(at least they had the living example showing all it's glory, crashing,
and not handling a simple clean audio track).
This whole ct2 thing just saddens me. That's all.
Have a nice day Jo.

Weird crashes are usually caused by overheating. My guess is that the fan has been flakey all the time, you just didn't notice it. Have you tried replacing the fan? Or improving the air-flow in any other way?

> The audio problems weren't noticable at the time (didn't test extensively
> this area at the time), You know, 100% compatible, scsi bug gone (as they

They claim that all Falcons can run at 25MHz without problems. This is bullshit, the Falcon just isn't designed for these speeds and I'm not surprised at all that problems arise after a while. Is it possible to run the CT2 at 16 or 20MHz? If so, have you tried it?

> I am glad you take this in a fun way. It ain't funny to me.
> anymore. You can spit on me many times, i will never really bite you back,

Don't take this the wrong way, I know very well what it's like to have my beloved computer die on me (I've killed it many times but always managed to resurrect it). I'm also used to being ripped off by various dealers and manufacturers. I suggest that you just grab a beer and take it like a man, because women always takes things too seriously.

> Well guess what I have to do? is to use this pc to finish my songs,

Why not just rip out the CT2?

> Have a nice day Jo.

I always have, even with as bad hangovers as today.

2216. Win a complete Atari Jaguar system at the Little Green Desktop

Newsgroup: comp.sys.atari.st
Date: 1999-11-14 00:00:00 UTC
From: Richard Davey <rich@fatal-design.com>
Message-ID: <382f00dc@news.gemsoft.net>
Source record: 70623
Cross-posted to: alt.atari-jaguar,comp.sys.atari.st,rec.games.video.atari

Hi all,

Our first competition was a resounding success. So to follow it up we have launched competition 2 today. Visit the web site at http://lgd.fatal-design.com and enter the compo to be in with a chance of winning a Jaguar system (PAL) complete with jagpad, mains adaptor and 2 games. This is a fully boxed new system, not second hand!

If you're interested in the Atari ST then take a look around the rest of the site while you are there.

Cheers,

Rich
Little Green Desktop

Just an update to the below:

Thanks to everyone who responded to my posting..
I am amazed at how many Atari fans still lurk out there,
I thought I was one of the last! The whole lot went in
about half an hour after my posting, and I have tried
to write back a note to everyone who responded
(sorry if I have missed anyone!)
It is good to know that there are still some
who remeber the "good old days" when
"Atari's Ruled the Earth" (my apologies to
Jurrassic Park)..

Cheers :)

Ah - that explains a problem with a SCSI disk for direct to disk
recording that was solved by fitting an IDE, mentioned in /ST Computer/
some months ago.

There was the bare bones of a new Atari browser at the Stafford show which seems to be /much/ faster than Cab with and without images. A young programmer is working on it and adding extra facilities as and when he gets time. Looks promising. At present only one font style (Swiss?) supported in several sizes, but that will change.

Regards, /Peter/

I have only just started to use ICQ and have also had a lot of problems -
although I log on ok.
Have you tried the previous version 0.40 ? as for me it atm seems a lot more
stable. If not it may be worth giving it a try just to see.

All the best

Have you stopped taking 'offline' orders now Danny? as I have tried to register software but have not had any reply. Also, have tried to download the iPRN II for MagiC from the site but it states 'file not available' or something to that effect. Have tried contacting you many times with no luck.

>The payment bit uses Secure server so some CAB OVL versons wll not

I tried selling it but there was just too much to ship... or inventory.

I have 8-10 boxes full of Atari ST and Falcon and 8-bit Atari hardware and software that I can't bear to throw out, but can't keep saving. It's yours if you come get it.

Included is nearly every '88-'94 productivity package including of course Calamus and such, plus such oddities as Silouette, and so much more. Lots and lots, very few games.

Also - TWO FALCONS!!! WITH HARD DRIVES. One works but the sound is flakey, the other is DOA. Plus a 520ST that might work. And a 256K 800XL and HAPPY1050 and lots of carts... and disks...

Books and magazines.

This is a playground for Atarians.

There's thousands of dollars here, and all I want is to MOVE IT OUT.

Come get it.

I'm mid-peninusula, just south of San Francisco Airport. Write back, tell me where you are and why you are the one that needs my jackpot, and leave a phone number.

BE SURE TO REMOVE THE NOSPAM in the email it you REPLY; othewise: mailto:itsyaya@hotmail.com

I don't think that is the problem - it makes a config file if you don't have one anyway. It seems to start okay but as soon as i try to do anything it say "the server forced us to disconect - may be due to network lag"

Could this have anything to do with sting???

TIA

Sean - the CAB.OVL that I know of that supports secure sockets works only with Mint - IIRC. Neither Dan Ackerman's nor Oliver's support ss at this time. So, if you want to use on-line ordering thru Denesh, you are going to be stuck using a PC/Mac or a Mint setup on the Atari :)

Ah, I've seen that message before in previous versions but the
latest MiNT port (v4.3?) seems to stay on-line quite well.
When I did see that message it was not right away, but more like
10 or so minutes into use or if I left it sit idle.

I think it's probably in the micq program itself.

2239. MusiCom 2 External Hardware Device wanted

Newsgroup: comp.sys.atari.st
Date: 1999-11-14 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <382e07b5@athene.hdm-stuttgart.de>
Source record: 70675

Greetings Atari folks,

I'm looking to buy or trade for the External Device that uses the
Falcons DSP port for the D2D software called MusiCom 2.

If you have this for sale or trade then do e-mail me.

If you happen to know where I might find this device or know
if anything can be subsituted for it then I'd like to hear about
it.

Thanks,
phantomm@kih.net

2240. WTB/Trade For Atari Items

Newsgroup: comp.sys.atari.st

Greetings Atari Folks,

Looking to buy or trade for the following Atari Items,

True Image - Original disks and Manual.

Clarity - Original disks and Manual.

4T/FX D2D - Original disks and Manual.

Also interested in any Non-Working Atari Falcon Hardware.

If you have any of these items for sale or trade, do e-mail me
and we'll try to work something out.

Thanks,
phantomm@kih.net

If it was from a PC, the file structure is slightly different and that
might cause a problem (although in that case, I'm a bit surprised
you'd be able to see directory entries). In any case, try
repartitioning the disk (any driver will do: AHDI,CBHD,HDDRIVER,ICD
..) and then see if you can write to it ...

>Fast, faster and fastest... can they all considered FastRAM upgrades?
>

The first two (for sure) and the last one (if it exists :-)) are just
memory boards to replace a standard 4MB board, and therefore are
ST-RAM boards. In the event that you were considering the Centek
Centurbo2 accelerator board for the future, be aware that the RAM
Gizmo does _not_work with it. [I don't know about the other two].

But a complete (well, almost complete!) pauper like myself can 'buy' linux
for essentially the cost of the media it comes on (CD-R etc...). Of course
some companies are making money from it however, which to my belief goes
against the spirit of the Linux philosophy a little...it is after all touted
as a FREE OS...

Thats not my point. I'm saying that Hasbro could stretch their considerable
resource to include programmers converting back to an existing user base
on genuine Atari hardware...a user base that has surprisingly large numbers.
PC and PSX of course would be their key business, but they could support the
genuine Atari hardware in the same way M$ supports Mac OS with some of its
key software. I'm sure well written games would sell to we Atari users
quite nicely...I for one would put some pennies in a jar to save for a game
or two if written...

> >I get the feeling Hasbro are backing the efforts financially
> >but using the Atari name because of copyright issues...
>
> Or the fact that it's smart business to use the name associated with those

Also agreed. Just think back to the 80's (ooops, showing my age!), anything video games WAS Atari...that name still brings good memories for many...

2252. Micq

Newsgroup: comp.sys.atari.st
Date: 1999-11-14 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <VOsX3.376$3Y2.634@198.235.216.4>
Source record: 70688

Hello,

I just downloaded Dan Ackermans Micq 4.3 from his webpage.
I ran STing and loaded Micq, it appears that it may work, but I don't know as it disconnected me right away.

Now before you start helping me, I must say that I don't even know what Micq is (hey I use Atari and I am not Mint setup) so I just wanted to try it to see what it does.

So first tell,

A) What exactly does it do. I assume it is similar to IRC and FRAC.
Yess I know I live in a CAVE:-).

B) I have read both readme files and cannot find any commands. Do these appear when the prg. runs?

C) How do I get this to work without bombing?

Well thanks for your replies in Advance.

2253. RVF RACER

Newsgroup: comp.sys.atari.st
Date: 1999-11-14 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <7PsX3.377$3Y2.634@198.235.216.4>
Source record: 70689

I have a couple of networkable games which I am finding to be good fun:-).

Anyways, for some reason RVF racer refuses to network properly.

I have 1 520ST linked to 1 520ST. Both can run the game. Linking them however gets the menu and a move of the joystick to select a track results in a lockup.

Does anyone know if this linking requires at least a 1040ST.

Anyways I have 1 520ST with 2.5 Meg of ram. I linked it to me 1040STe with 2 meg of ram. Unfortuneately to run with greater than one meg results in RVF locking up. So I discovered that if I ran the 1 meg fix of Railroad Tycoon found on a STformat mag, this allowed the game to run. However when this is done the machines do not acknowledge that a link exists between the two.

I have downloaded every crack version out there only to discover that the versions that exist don't include the link feature.

1)See there is a point to paying for commercial software:-).

2)The crack versions run on all machines without need of the RR Tycoon fix.

Anyways it is the commercial version I am speaking of here.

Now finally STunt Car Racer works just fine in link mode, even runs on my Falcon without anytrouble;-).

Well besides this I have a big Midi Maze game about to take place:-).

2254. MidiMaze

Newsgroup: comp.sys.atari.st
Date: 1999-11-14 00:00:00 UTC
From: madmax@bfree.on.ca

Source record: 70690

I was just wondering out loud, loud enough for the world to read.

There are alot of network games people are playing that us ST users cannot participate in.

How difficult would it be to take a game such as a midi maze type of game and adapt it or create one that would work through TCP-IP connection?

Nothing could please me more than to shoot some smiling French Canadian with a TT under his fingertips, while he sits timidly in his European hideout praying to the Mint Gods for help.

Perhaps this is a result of signal loss somewhere along the way? Does the display look normal when being driven at higher resolutions through a direct connection to either machine?

> And when I decided to open the switchbox to see if there was anything
> wrong, I noticed that the screws were magnetized. NOT a good sign?

Hmm.. shouldn't be a problem, unless these are neodymium screws (read: very strong magnetic screws) or something like that. :)

Hi all,

I bought a Atari Mega ST1 in the 80's (probably 88 or so). My first 60 Mega drive crashed after 13 month -no guarantee :-(- and my second SCSI Harddrive crashed too short after the guarantee went out.
After that I was unsatisfied with Atari (noboy wonders, I think) even though I had always liked the programs and the system. I bought a DOS/ Windows PC and since then my Atari (without Harddrive) stood in a box, unused. I couldn't bring myself to give it away, however.

Now I stumbled about my old Atari and I wondered, if there is any use for it. I found this newsgroup and was very surprised about the traffic in this group. It rekindled an old fire in me ;-) .

-> Can anybody tell me, what possibilities I have with my old Atari,

* can I connect it to the Internet (do I need a "normal" Win/ DOS -modem with serial cable? With kind of Software do I need (only E-Mail would be OK)? Is it possible at all without a Harddrive, only with 720k Floppy drive?

* can I connect the Atary with my DOS/ Win PC?

* In 25th Oct. John Kolak wrote, some STE have defective DMA chip that scrambles the hard drive. Could that be the reason for the problems I had with my Mega ST?

Thanks, Peter

Hmm... check and see what the file looks like in a text editor. Make certain you don't save unless you can save with just LF's for the end of lines

Also it might have problems if you are using masque.stx. I don't use it here, but there is a possibility of problems there.

I use it with no problems under STiK.

Please someone correct me if I'm wrong...

ICQ is a little different than ICQ in that you don't join any channels to chat. With the PC/Mac versions you can chat directly with someone else who is running ICQ in a separate window, and even hold conversations with groups. PC/Mac versions are generally (at least on my father's PC) set up to run automatically when connected to the internet, so the ICQ client constantly checks and tells you in your "ICQ list" is online, and if they are you can initiate a chat with them. The Atari version is actually quite limited, I've found. It doesn't check automatically who's online (and with mine, even when you manually check, the info hasn't ever been correct -> I've had my father get online with his ICQ client, and he can see that I am online, but I am always told that he's offline). And you can only send the equivalent of AOL's instant messages, manually typing the "msg" command then your message.

>B) I have read both readme files and cannot find any commands. Do these
>appear when the prg. runs?

The commands can be accessed by typing "help".

>C) How do I get this to work without bombing?

This depends on a few things. First, what OS are you using? On my Geneva setup, it crashes right away (I get the TOS window, with a 'M' in the corner, then two bombs). To get it to work, I must either put the Geneva TOS program into Single-tasking mode, or run Mint with Geneva for Pre-Emptive multitasking. Both of these options at the moment aren't very great solutions for a permanent setup. I'm working on that, though.

Also, I've found that version 4.0 is a little more stable than version 4.3. Version 4.3 is constantly complaining about dropped data packets or something like that, and after a few times displaying that error, crashes. 4.0 didn't do that. Anyway, I'd love to see someone come up with a GEM version (like Dan Ackerman suggests in his web page) based on MICQ, and if possible add the ability to constantly check who's online (and give correct information), and do a full chat like the PC/Mac versions described above. Any takers? PLEASE?!?!?! :)

|I didnt make it to the show :-(, so what was it like who turned up what
|new products were released etc etc etc. Thanks in advance for the info.

Atari Computing with issue 16 (the last). Very sad but I suspect
those involved will have a lot more time to relax in. I had to leave
at 3 pm so I don't know if the farewell party took place.

System Solutions had lots of things for sale and they brought the
Phenix and its hardware designer. Nice to see them both but the
software was not finished so that it only showed a pattern on the
screen (an imac). Interesting to see that the board looked a lot
less complicated than the Hades - more integrated. Unfortunately
Papyrus 7 was not available at the show - a lot of people seemed to
be after an upgrade.

Mario's Qwertyz was there (allows a pc keyboard and mouse with your
ST), also his Mouseburster. Also a finger pad or trackpad or
something - a surface that you slide your finger over and it moves
the screen cursor.

Lots of other stalls and people selling this and that.

John Logan

|Pros and Cons would be appreciated.

Well, as I said a while ago in answer to a similar question, I would avoid the Milan because of their dependence on Magic. I have a Hades but will definitely consider a Phenix which has a modern hardware and software design and offers up to two 060 processors. It is said to run GEM compatible programs but is not based on TOS.

Oh good, glad to see Nevlyn is back.

> what i meant was to create a usable web for the atari. i.e SSL, CGI,

Excuse me?

CGI is a server-side scripting system, not a client feature. As
for SSL, if you use MiNT-Net, we have a CAB.OVL with SSL.

> JavaScript, the lack of these protocols in CAB is forcing me
> to use PC's more for the WEB. Just don't want me Atari left
> behind in the e-commerce way of business.

Javascript and CSS are the only two things CAB currently misses.
While Javascript is sometimes usefull, CSS is very much optional.

This address contains the original UTSI which isn't maintained any longer.
If you want a more up-to-date list go to my UTSI pages. (see my signature)
For the moment I'm reworking the pages again. As I think the majority of
this list is using a frame capable browser I've implemented frame now.
This should work better (I hope).

Hallo Oeystein!

O>I got "first word", but I haven't got a printer driver for HP deskjet,
O>where can I find it?

That's kind of difficult, as the language concept of HP-PCL is quite different
from ESC-P and the printer drivers of 1WP are not flexible enough in order to
allow the use of all features.
You could try Idealist to print your 1WP documents.

It's not just the atari version. That's micq. There has been
talk on it's list lately about how to include chat.

This one stumped me. I don't have Geneva at my machine to play
with so I can't really test it. The odd thing was that if micq crashed my
ftp client should have as well. But people would be able to run ftp but
not micq !?!?

> >Also, I've found that version 4.0 is a little more stable than
>version 4.3. Version 4.3 is constantly complaining about dropped data

Have you tried the most recent update. When I recompiled it this
time I disabled logging. I hadn't got enough messages the first time I

ran it to see it doing that.

>error, crashes. 4.0 didn't do that. Anyway, I'd love to see someone

>

The offer still stands. I'll help anyone with the networking
section that I can. If you go to the new micq page (the url is on my
page) and register what you would like to see, maybe someone will see that
there is enough interest to spend the time.

Also wanted to say 2 other things.

1. Sorry about the posts with the "interesting" email address. I
forgot I did that to my machine at work. Didn't want anyone else coming
in and having fun.

2. Someone asked about my CAB.OVL in a different thread. I'm not
opposed to working on it. Just have many other things I'm working on as
well. That and my real life is awfully busy these days, so I don't get as
much time to program as I used to.

Just wanted to follow up and apologize for the "interesting" email
address in my last response. I explained this in another thread.

Anyway for anyone that is interested. If you go to
www.place2be.de and go to the links page, you will find a page on
Midimaze. If you go there you should find links for a few other projects.

One is "The Maze" Which had a TOS port several years ago (code is
still in the base, I had a hard time compiling it on my machine). This
has some networking functions in the Unix version.

Another one is Imaze. This hasn't had an atari port that I know
of. I believe it's functional and might still have a few servers running
around the planet.

There is a 3rd but I can't remember what it is. It would be nice
to have one of these up and running in a window of a decent size and
resolution. 1024x768x8bit color anyone ;)

As I stated before. If anyone is up for getting the main game
code running, I am willing to help with the networking section.

Hey all

Thanks to those of you we asked about whether ST+ should stay as HTML or as Paper, and well the results were very surprising, they were in fact even which means that we will be producing both.

The paper issue will be every 2 months, and the 1st paper release is expected in January in the Year 2000 :)

There is currently an "unfinished" issue located on:

http://www.inner-city.demon.co.uk

and the finished release will be uploaded on 5th December.

Thanks.

Kev.

hi,

yes, HighWire by nevlyn. Saw it too, and hope he keeps going withit he seemed to have multithreading going as well.

Back to the original post, turning off images is all very well. But what i meant was to create a usable web for the atari. i.e SSL, CGI, JavaScript, the lack of these protocols in CAB is forcing me to use PC's more for the WEB.
Just don't want me Atari left behind in the e-commerce way of business.

yours

Paul Mc

On 14 Nov 1999 12:50:10 , Katherine Ellis wrote:

<snipped>

Very sorry to hear about your problems with the CT2.
I know how you must feel, I've went thur this with a
bad Nemesis 25/50mHz version. Just about sold my Falcon
over that.

However, I gave it another chance with the CT2 version B.
And am extremely pleased with it. As you probably know,
any time you push the Falcon over the stock hardware you
risk losing something, software compatibility and etc.

My CT2 version B isn't perfect, no accelerator is, But
I can honestly say that its really nice, Fast and Stable.
ALot of Audio stuff I have tried does work fine in Turbo
Mode. Some won't. But I can always just flick the switch
back to standard Falcon Mode and it all works just as it
did before I installed the CT2 v.B.

If I remember correctly from talking to you on IRC #atari and
#atariscne you have one of first CT2s, the CT2 version A.
I really don't know anything about the A version, other than
from the looks of the pictures and diagrams, The A version
looks completely different than the B version.

The Centek Manual that I got states that there is a lifetime
warrantee on the CT2. I would think that this also applies to
the A version as well. If so, I would certainly take advantage
of it and get Centek to repair or replace the CT2.

If you do have the A version, maybe with the warrantee you
could work out something with Centek that would allow you to
upgrade to the B version which is probably a much better design
than the A version.

Not sure if the A version allows you to switch back to the
Standard Falcon mode or not. The B version does, so that you
can use any programs that fail to work with the FastRam and or
the Speed Increase.

I don't mean for this to sound like a Advertisement for Centek,
its just from my experience with the CT2B, its a really good
piece of hardware. And I'd like to see your Falcon up and humming
away again. ;)

If you can work something out with Centek for a B version, do give it another chance. I think you'll be pleased with it.

Hope things work out for ya,

Normally I don't jump into a Flame War, thats just not my style.

But I've seen posting after posting from Mr/Mrs/Miss SinClair over
many months if not years bashing the Atari Platform.

The real reason he or her as the case may be, does this is that
he/her really wants to find out as much info possible about what
is going on in the Atari world. So he continues to bash it to death
trying to squeeze all the info he can out of any Atari user.

He/Her is just a Spy who insults the Atari Users trying to get
info on new projects and etc. I've seen constant errors relating
to Atari stuff that anyone who posts/reads the Atari NewsGroups
as much as he/her does would already know.

I usually don't ask or tell folks what to post in CSAST.
Again not my style.
But I really grow tired of seeing this child like junk in here
from Sinclair. If you want to post this junk then fine, but do
it in MAC.ADVOCACY or ATARI.ADVOCACY.

From what I have seen, modern hard drives take far less power to run
than older drives, even much lower capacity older ones. So this
actually helps your power supply, when you replace old with new.

Current draw ('amps') are usually (always?) marked on the drive. Use
this as your guide.

These machines have been claimed. I thank Dan for Giving them to me.

Now Some of you will wonder just what condition the machines were in and I shall tell you.

2) Mega STe with 4Meg ram and 50Meg hard drives.
1) Mega ST2 with 2Meg ram and 30Meg Hard Drives.
1 SC1224 Colour
2) SM124 (Small Monochrome Screen)
1) ATari Flat Screen Mono Monitors (Not the Sm125)
Various Assorted Software.

I just spent about 1 hour testing them all and everything is in fine working condition. It would have been a shame if they did go to the dump.

Dan is simply a great guy who has just done an Atari Enthusiast a great favour.

Later Brian.

CGI -- Common Gateway Interface; is not browser specific, it depends on
if the web site you are viewing uses it, and whether the server it's on
supports it.

SSL -- Secure Socket Layer; not sure about this one, whether or not if
it's strictly a server thing or browser/server thing.

JavaScript -- well, that's in progress, but not for CAB.

Ghost Link is kind of like that, and with some tweeking could probably
do something similar. It has a GUI interface, connecting to a PC by
serial port, but the PC must be running under DOS and have Ghost Link
running on that machine. Maybe this is old news....

You've got it all wrong, Phantom. sinclap is not a person,
it's a random string generator. Medical studies have shown
it's impossible for a real person to be so sad and boring.
I've been studying sinclap for several years, and suspect it
contains an artificial intelligence algorithm which gathers
information from the newsgroup it's running in, and adjusts
its text rendering engine to reverse-bias accordingly.

Therefore, if you run it in an Atari group, it'll Atari-bash,
and if you run it in a religious group, it'll bible-bash...

The really great news for us Atari users is, since I last
posted on the subject, my software team has made great
progress on the sinclap suppressor software. On a standard
8MHz ST, we now achieve 93% suppression thanks to highly
optimised assembler programming.

One radical idea we have is to make the software modular,
so other developers may create transformation (rather than
suppression) modules to turn the input garbage into something
meaningful and perhaps even beneficial to the community. For
example, an English language Atari magazine to replace the now
sadly defunct Atari Computing. Judging from the prolific output
of sinclap in this group, I think if someone could perfect a
transform algorithm to create high quality editorial, we could
look forward to a superb monthly magazine of over 200 pages per
issue! How does that grab you?

>But I really grow tired of seeing this child like junk in here
>from Sinclair. If you want to post this junk then fine, but do
>it in MAC.ADVOCACY or ATARI.ADVOCACY.

I'm afraid it probably doesn't work like that. See my second
paragraph here. If you run sinclap in an advocacy group,
you'll get the opposite result.

2329. ST and Y2K question, once again please help...

Newsgroup: comp.sys.atari.st
Date: 1999-11-15 00:00:00 UTC
From: dogs19 <seperite@yahoo.com>
Message-ID: <382FE543.46B3115E@yahoo.com>
Source record: 70585

I need to reiterate my previous question from a few weeks back, apparently it wasn't understood properly...

I know that because the ST has no internal clock there's no reason it should conflict with Y2K and not boot or act weird. My question concerns a FA*ST ICD 85MB hard drive I have that DOES have an internal clock. Does anyone know if this formerly standard ST hard drive will quit working or do something funny when Y2K hits?

I ask, because I no longer have my ST, but have many files stored on that HD in a closet. If there's a fear that they may become irrevocably damaged after New Year's, then I want to get my hands on an ST quickly, copy the files from the drive to floppies, and store them on my PC.

So, to reiterate, does anyone know if Y2K will conflict with/screw up (because of the internal drive) the files on my Seagate/ICD hard drive? Any help would be much appreciated. And if there's anyone in the New York area who has an ST running and would be willing to allow me to hook up my hard drive to copy files off of it soon, I'd be greatly indebted to you.

Thanks.

I think the Milan is the future.The motherboard of the new Milan II 060 which will be released spring 2000, is made by Motorola, and thus of quality. Onother big firm, Axro,
will distribute the Milan, so Milan themselves can concentrate on the hardware.So it' s all well organised. As you might know the new Milan will have Magic Milan aboard which runs very stable.Magic for Hades isn't very stable if have heard from a Hades user. Besides that the Milan TOS is constantly beeing upgraded, we have seen 3 or 4 updates since the release of the Milan in 98. I own a Milan 040 since 98 with Magic Milan and I am very satisfied. I can run Cubase Score on it and SPP 3.2 and it' s very fast.Nearly all my old software runs on the Milan. Browsing goes very well too with Iconnect and CAB and thanks to Ifusion I can use nearly all the Sting clients via Iconnect.

2331. REQ: AFIX utility for NVDI

Newsgroup: comp.sys.atari.st
Date: 1999-11-15 00:00:00 UTC
From: sergeys <sergeys@mpx.com.au>
Message-ID: <80or3o$6jd$1@news1.mpx.com.au>
Source record: 70587

Hi.

I'm having trouble with vector fonts when running NVDI and TosBox
in resolutions greater than 640x400 eg. 640x480x16. The fonts appear very
tiny! I have read on the Official TOSBOX Mirror Site that
a utility called AFIX will remedy this problem but I could not find the
utility on that site (no response from the author of the site either).

I was hoping somebody out there knows where I can download this app or maybe
email it to me.

Thanks in advance.

sergeys@mpx.com.au

No, there is GT-LOOK !
It seems that it's running with parallel, parallel+midi or SCSI port for
Epson scanner.
I have an Epson GT-7000 SCSI and the soft works fine (but i have tried
only with SCSI).
And it's free now !

Okay a short simple message,
1) Does anyone know where I can buy an IDE hard drive controller for an atari STFM, I don't mind soldering it to the m/b.
2) I want a Falcon very badly for music (I'm in the UK) if anyone has a second hand one or knows where I can get one.
3) I have heard rumours that there is still an Atari mag going in the UK how can I get hold of it?
and finally
4) Is there still an Atari Demoscene

There are several MidiMaze clones on the Web. At least one was ported
to the Atari at one point in time, it's kind of dreadfully out of date
though. If you can interest anyone in porting one of these programs to the
atari, I am willing as time permits to help with the TCPIP coding. The ones
I looked at were fairly simple in the networking section. I just would like
to see it run in something other than ST Low resolution.

> manually start it).

Overheat if the fan doasnï¿½t spin, remove it, only two solder points.

Remove EDO, have a look to the connectors, clean it, replace it.

DO NOT use flash.bin after V 2.01, displayed while boot up.

Any later flash.bin moved MY falcon, not imeditaly, most after some
days, into a very big pice of unstable shit. Canï¿½t gave some answers
more, but i can stop that bullshit with my old german flash.bin

So i quit flash new files and i have a realy stable machine.
Weekend run of the falcon is more as 20 hours non stop.
And itï¿½s a "A" board.

> The audio problems weren't noticable at the time (didn't test extensively
> this area at the time), You know, 100% compatible, scsi bug gone (as they
> say). (when originally my falcon was patched correctly, and cubase audio
> used to work perfect, as I was even able to finish my songs.).
> Not anymore, this is a falcon right now, music less. (well plays wav files
> and play/record MIDI),. but not serious at all for me.

Canï¿½t say more about "Falcon and musik" but i know that some other
germans here also used an CT2 perfectly with music software.

Some had trouble if the display is connected to the same wall outlet as
the computer. Noisy music as result. Connect display to another outlet
stops noises on audio. Otherway is to take an simple AC power filter.

> I am glad you take this in a fun way. It ain't funny to me.
> I have a falcon, have to finish some songs, I can't play around with
> centek deaf/insulting attitude anymore, don't have time and patience

Sure, but if the falcon doasnï¿½t work, isnï¿½t self repaired hardware :)
I know that a lot of problems kill any fun..
But.. :)

> anymore. You can spit on me many times, i will never really bite you back,
> I just get tired. I flushed 50 bucks on an FPU chips right down the
> toilets, that aggraved me also.

What kind of FPU do you got?
Needs a 33Mhz type as minimum..
16Mhz wonï¿½t work fine.

> Well guess what I have to do? is to use this pc to finish my songs,
> At least no more crash and cracks and pop from the falcon, and that is
> very good for my singer and guitarist.

Long wires..
Audio wires crossed with AC wires..
Monitor..
Halogen spots near of the hardware..
Case unshilded..
Wires unshilded..

Needï¿½s a lot of time to found out which is the creator.

> This whole ct2 thing just saddens me. That's all.
> Have a nice day Jo.

Yes..
But donï¿½t give up ;)
Any problem can be destroyed.

German: Der Satz "das geht nicht" existiert offiziell nicht!
Translate it :-))) (Donï¿½t kick me) ;)

Very litle similiarity. In a way it's kind of a bizarre take on IRC,
but I'm not certain that comes across to the user.

>B) I have read both readme files and cannot find any commands. Do these
>appear when the prg. runs?
>

Yes once you connect you can type help and see what commands are
available.

>C) How do I get this to work without bombing?
>

Did you create a new UIN? Without a valid micq.rc file, it can't run.
If you tried and it failed. Go and get 4.0 and run it and create a new UIN
and that should work. Then you can copy the micq.rc file from 4.0 to 4.3.

HDDriver v7.71 doesn't do it, but, it is possible to split the 3rd
partition up, whilst leaving the other two intact?

(Diamond Edge has this facility, but doesn't like the size of the
partition and gives some very strange info that is incorrect!)

Most a very aware of it, but assume that Netscape is available on
enough platforms that it covers the majority of Netizens. Quite
frankly, they are right.

Anyhow, we better learn to shut up and implement Javascript as
there isn't any way we can convince 90% of the planet they are
wrong in using tools that have existed since nearly 5 years.

2348. Geneva GEM.CNF files needed

Newsgroup: comp.sys.atari.st
Date: 1999-11-16 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <3831c85a@athene.hdm-stuttgart.de>
Source record: 70404

Greetings Atari folks,

I'm looking for some examples of Geneva GEM.CNF files to get some
different ideas on setting up various programs and etc under
Geneva.

If you are a Geneva user who has Apps and etc setup in the GEM.CNF
file, I'd really appreciate a e-mailed copy of your working GEM.CNF
setup. I'm along time Geneva user and am abit short on time these
days when it comes to experimenting with different setups.

It would be helpful if you could pass this info along so I can get
a good idea on how to better improve my current Geneva setup without
wasting alot of time on trial and error.

Any CT2 owners out there besides me using Geneva? If so, have you
found any useful tips on configuring Geneva with the CT2 for even
better preformance?

Also could use any info or file examples of running Geneva and Mint
together for a stable system.

Future Thanks for any help,
-phantomm@kih.net-located in the USA on planet Earth or so I've been told.

2349. TOS programs in a Window?

Newsgroup: comp.sys.atari.st
Date: 1999-11-16 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <3831c85d@athene.hdm-stuttgart.de>
Source record: 70405

Was wondering if there is any OS or software for the Atari Computers
that will allow TOS programs and others that take complete control
of the Computer to be ran in a Window similar to other programs that
allows this.

For example the VideoMaster ST and Falcon software takes over the
whole system when ran. I'd like to run it and others like it in a
window so that I can put the program in the background if needed and
run something else without having to exit the VideoMaster Program.

Is there any way to do this?

2354. CT2 recommendation

Newsgroup: comp.sys.atari.st
Date: 1999-11-16 00:00:00 UTC
From: sandrija@pravo.hr
Message-ID: <80smsj$5lo$2@as102.tel.hr>
Source record: 70410

Centurbo 2 recommendation

After hassling with various accelerator cards (Speed Res Card, Nemesis, etc..) and normal Falcon,
installing clock patch and watching dongle CAF break down regularly due to the SCSI problems, I saw
CT2 in November 1998 for the first time.. It didn't take much time to register its speed and stability...
Unlike all I've seen previously this card really worked trouble free.
After considering the Centek's data at www.centek.fr I made the onyl logical decision: get one asap!
It is a real solution for every Falcon owner: speed increase is very good, screen resolutions are greater and
with a solid refresh rate, amount of upgradeable RAM is really amazing (up to 256 Mb on a rev. B machine)
- not even t mention the speed of CT2's fast RAM, SCSI now works with no troubles and connection of
modern and fast IDE disks (9 Mb/s transfer rate!) is almost trouble-free (2.5" to 3.5" adapter is a must...), the card itself fits in
Falcon's case along 3.5 IDE drive (almost trouble free ;)), some of the adjustments have to be made, of course,
(fan, finding space inside the case) and soldering is better to be made by a professional...The card has a flash rom
system (Dolmen) which controls the boot sequence and all neccessary parameters on Falcon. Hardware switch makes
possible switching to normal Falcon (not almost normal, since the Centek's clock patch remains even in normal mode).
Possible modes (with modified TOS) are 4.0x and 7.0x (this is the mode when Fast RAM is used so the speed gets to
the max...). Compatibility is excellent: everything works! Well, not everything - some demos, some old programs and games -
but all the major packages work with renewing speed! Using APEX or CAF now gets really fast and safe, CAB gets wings with DSP
clocked to 50 Mhz and jpg.ovl, Photoline, Neon or Phoenix are pleasure to use due to the 50 Mhz clocked FPU...
Falcon may be connected to all possible devices - scart VCR, SCSI devices (scanners, hdd, cd rom and cdr/crw...),
all kinds of monitors (Atari SM series, VGA, RGB), audio components (hiss and crack free), fast modems, printers, DSP add-ons, etc.
My Falcon turned to real allround home computer with capabilities of some expensive platforms...
The price is always the big question and although I think it would be great if it could lower, every "nickel" you invest
will surely come back!

Although Centek prepares its new surprise - Phenix computer - this accelerator card is a worthy contribution to remaining Atari enthusiasts
and thing worth recommending!

Advantages:
- speed and screen resolution increase
- compatibility
- stability
- flash rom updates and system
- fits in a Falcon's case (although with adjustments)
- support (installation and there is special software written for it in order to use its capabilities)

Flaws:
- absence of extension slot on rev. B
- on some Falcons DSP and IDE speed have to be put on wait states (slowed down)
- adjustments to be made when CT2 is installed into Falcon's case (CPU fan and SIMM module are too close to keyboard, so
minor adjustments have to be made)

If everyone does not know by now, CAB 2.8 is scheduled to be released at the upcoming atari fair in hannover.
However, I do not know if it is CAB itself that is being updated , or the CAB pack in programs. (Or both?)
Anyone have any further information on this?

Hello all,

I'm looking an ADA language for my Falcon.
A friend of mine told me this language was ported to our
machines but the files are on the "Compendium CD".
I don't have got this CD, so what can I do ?

Thanks !

It does ... I've been using one for the last two years. It's ST-RAM,
just like the others.

Dear Sasa,

This is quite a glowing recommendation you wrote. I too have fooled with Nemesis and FX, and now Rodolphe is working on my Centurbo. I am glad to see that your reports of stability agree with his.

I know I have corresponded with you before, but I think this is the first time I have noticed you are on the Croation Atari Team. My ancestors are Croation, most coming here to the US before World War I. I wrote a member of the Yugoslav YES crew once, but I don't think it was you. I am always interested in contacts with Croatia due to my background.

Yours,

John

The short answer is that you won't have any trouble with this drive
come 2000.

The clock that's built into it was meant to be read by ICD's hard
disk booter, and used to set the ST's clock. I don't know of this
clock is Y2K compliant, but that's another question.

If you want to copy the files off this drive to a PC then you will have
to disconnect the ribbon cable from the back of the mechanism, and
hook it up to the SCSI bus in your PC.

Indeed it was - I couldn't believe the prices that they were
knocking the Lynx and Jaguar consoles out for. Came away with a few
Lynx games at a fiver each, wish that I'd sprung for a spare console
too.

I don't suppose Telegames are still selling at that price, no
offers on their web site AFAICS.

I don't think that this would be a very constructive idea TBH. As it is, there seem to be some people who can run programs that others can't, and that's with standard Ataris!

I don't think that you should hesitate, get in there with the soldering iron - I know that you will be knocked out by the results.

And if you do run into a program that won't run (I haven't come across any yet!), then you can retutn to a standard Falcon by operating the switch.

On 15 Nov 1999 19:56:33 , Mark Friedman wrote:

Thats a good idea. Since Falcon owners use their machines for lots of
different things. I'm a bit surprised to find that not many CT2 owners
post anything about the good or bad experiences and software problems
or enhancements regarding the CT2.

Awhile back I attempted to start a software list of programs CT2 owners
were using in Turbo mode but only 1 person e-mailed anything. :/

Off the top of my head I have ran into 2 software oddities in Turbo
Mode.
When using TruePaint in TrueColor Mode I cannot select a color from
the Color Wheel for some reason. However if I load a picture I can
pick a Color from the picture. All other options seem to work fine.
In 256 color mode I have no problem picking a color from the palette.
This is in 800x600, I'm fairly sure this also occurs in 640x480 TC mode.
Has anyone else noticed this or can someone try True Paint in Turbo TC
mode and see if they have a problem picking a color from the ColorWheel?

Hopefully there's a simple fix for this that I'm over-looking as I use
True Paint alot.

VideoMaster Falcon, When recording video in Turbo Mode the video display
is not centered correctly. The video is clear, but seems to be pushed up
in the display window about 1 inch leaving the top part of the video cut
off and a 1 inch blank at the main bottom. It is like the Verticle
on a TV is just slightly out of adjustment.
If I record video, the recorded file will playback out of adjustment as it
looks in the main display window.
Audio Recording in VideoMaster Falcon is just fine, and if I load a previous
Video recording that wasn't done in Turbo Mode then it does play back and
display correctly.
Switch back into Standard Falcon mode and VideoMaster Falcon works just
fine.

Anyone know why this happens and a possible fix for it in Turbo Mode?

On the Plus side, Apex Media version 2.41 will allow you to work in
640x400 or is it 640x480??? in Turbo Mode and uses the FastRam, on
my 17' SVGA monitor! For me, that alone is worth the price of the
CT2. Without a accelerator Apex Media would only do 640x400 TC on a RGB
monitor.

Apex Media version 2.00 will not allow the 640x400 in TC mode on a
SVGA, not sure about any versions between 2.00 and 2.41.

The disk can have any size, the partition size is limited by TOS.

> I'm using HDDriver v7.71 and am having trouble accessing a 2.1Gb partition
> on a SCSI drive. It's the 3rd partition, BGM and follows 2 RAW's.

This is normal since TOS 4.0x doesn't support partitions larger than 1
GByte.

> ps I've also got an AB040, if that makes any difference.

No, this is a TOS issue so it's the same for all machines running TOS
4.0x.

J> Is there going to be a Falcon compatibility card for the Milan?

For Video: no, that makes no sense.

You can either use Stephan Wilhelms StarTrack board, which gives
excellent audio quality (much better than any falcon), and runs all
falcon audio software that does not use direct hardware access, and
some that does. Or you can wait for the card which WOller systeme is
working on - I hope we will hear more about that on the fair on
friday/saturday.

Bought Joe Conner's Milan at the show and a lovely beastie it is too.
E-mailed Joe and went onto Jorgen Nyberg's page to ask them both for
help re accessing Milans high speed serial ports. Got replies next
day!!!

Now that's service! We may be few in number, but feel the quality!!

Hello,
That's good news !
Did you manage to get Sting working via the high speed serial ports ?It's
strange, on some Milans of Dutch users Sting doesn't recognize the fast
ports, on other Milans it does although we used the same setup.
Iconnect works without problems via serial 2, the Draconis stack too.

Thanks in advance,
Dan (nl)

There is a slight problem due to the way Cab handles files
it downloads ...
It expects the files to finish downloading before it passes
them off to programs like aniplayer.

If anyone wants to write a plugin for Cab that passes off
the file before it has finished d'loading and if Aniplayer
can cope with streaming ... who knows :)

TBH though, parrallel port drives are so stupidly slow even on a PC it's not really worth it. The extra 10ukp or so for the scsii version gives both a faster and (if you have to buy an adapter as well) overall cheaper as well as more stable drive. I've been using a scsii zip drive with HDDriver for over 2 years and it works a dream. Also with HDDriver u can read and format PC zip disks (unlike some other drivers that use a generic atari format).

> there are commercial clients as well and they are in most cases easier
> to install and use.

Don't forget Stik ...

also, as a side point, these are not dialers, they are known
as TCP/IP stacks. Of cause, this doesn't change how you use
them or how you install them but it is usually a good thing
to get the terminology right :) A TCP/IP stack does all the
talknig with the internet and allows other programs (like
www browser) to talk to the internet without having to do a
lot of hard work with al lthe strange protocols the internet
uses.

MintNet is for Mint (unsurprisingly) while Stik, Sting and
soon Stik2 are for Gem and Mint (if you use gluestik to
allow mint programs to talk to stik...)

All a little complex but really it means you just need the
program :)

If you need any help with setting up stik or sting, you can
email me directly (I do zetnet atari support - zetnet being
a uk ISP that doesn't mind atari users <g>). My email is

Nevlyn@the-asylum.zetnet.co.uk

I will try and help if I can. Of cause, the newsgroup is
always here :)

My www pages, based around the zetnet ISP are at
www.the-asylum.zetnet.co.uk

Eclipse is, in theory, released. However, problems with the
manufacturers, then the family troubles dave has had to cope
with has basically halted most if not all Cortex Design work
for the moment. I do, however, know that the Eclipse has
been assigned a USA distributer - is it not listed on the
cortex design www site ?

Try sending him an email, but be warned that it will take
him time to reply.

Ok

I'm the owner of a ct2 ; I have no prob exept, sometimes, some
crashes but, it seems that the falcon had problems before ct2, not
sure...

A lot of things are working very well, and I think that, anyway,
falcon is no more operational without acceleration and decent
resolution !

Problem : the fan on the 68030 has stopped ; I've changed it and now
it's right

Second point : i can't until now put another ttram chip than the 16
Mo one witch is on the the ct2 ; it seems that the ct2 accepts only a
few type of chip, very difficult to find at a good price ; i need one
'cause i've got an A4 scanner, and pictures are often very large

cordialement,

Christian

You probably do :)
But for pure Atari nostalgia you just have to have one of those sleek black boxes too I reckon. And at that price, hell, who could resist? Even if all you ever do is finish Cybermorph it's still worth it. The Lynx were good value too, but I didn't buy another one, I did however treat myself to a few games and have managed to rack-up a damned good score on Surfing on California Games (anyone beat 2100? :)

> yes i was amazed at the lynx prices as well.

'scuse my French, but their prices pissed all over 16/32 who still seem intent on ripping ppl off for those games!

> Good... A succesful day then :)

Indeed. Even though I was amused to read I was taking over ST+ (in Atari Computing). Which, err.. isn't true and never has been. Just don't have the time!

Cheers,

Rich

Well, theres the culprit. I am running Geneva. And since I have had
marvelous luck with Genevas Stability (even though it is slower) I haven't
bothered to replace it with Magic since purchasing the Falcon. When you
find a more permanent setup Let me know. I like Geneva. In the meantime I
am not too bothered going to single tasking mode however that does limit
the benefit somewhat.

Has anyone been using family tree? This is a very slick prg. What I am interested in is if anyone has supplemented the program via desk accs or multi tasking by adding pictures or maybe even video, let alone long text files. If you have done this I would be interested in knowing how it was done. As it is I am very happy the prg, and it works on everything I have from my ST TOS 1.0 to a Falcon. Eventually I intend to have alot of STs set up at a family reunion where they can click there way through the Gene Pool.

Later Brian.

>

THanks for the url. I am not certain what it would have to be in low res,
the versions of midi maze I have work on both colour and monochrome. I
think I have one that is colour only.

As for interesting others to participate in porting, I will do my best, but
clearly there are more users than programmers here:-).

I think that midi maze or TCP-IP maze is absolutely needed. Clearly in the
must have category. Somehow in a short period of time I have amassed a
large collection of STs and invite friends over for midimaze and beer.

I need TCP-IP to keep these mongrels away from my beer:-).

Seriously, what better way for all atari users to get together for Friday
Night MidiMaze and Saturday Night Atari Chat to boost about how you won the
previous evening.

All problems of which is the best

Choose one:

A)OS
B)CLONE
C)...

would be solved over a friendly game of midi maze.

Anyways, it is easy to learn mindless fun.

I hope the are others interested.

Brian.

>
> As pointed out recently by Uwe Seimet, replacing the main floppy
> by an LS-120 is a bad idea since, should your boot drive (e.g.
> the internal 2.5") fail, you cannot boot from floppy anymore.

If one reverses the traces for control lines of drive A and B on
the motherboard, one could install an internal LS-120 and use a
floppy on the external drive connector and still have it detected
as drive A, then install the LS-120 as drive B.

This would have the advantage of keeping the regular floppy, but
as an optional device one keeps home for backup/copy purposes and
for the occasional emergency floppy boot.

Right.
The hole machine isnï¿½t designed as high speed high end machine.
Itï¿½s simple an atari. Some do the job, some not.
Bus, DMA, SCSI and last but not least, audio recording wonï¿½t work
perfektly on all boards.

> than the A version.

Right, but thatï¿½s not the point. I have also a realy early "A"
board and the machine works perfektly any day.
Warranty is fine, but a long expensiv trip for the falcon.

Maybee the last(best)? way.

> Not sure if the A version allows you to switch back to the
> Standard Falcon mode or not. The B version does, so that you
> can use any programs that fail to work with the FastRam and or
> the Speed Increase.

Same as "B", "A" only had an older FAST RAM conroller, other layout and
the falcon bus is on a slot on top of the board. Thatï¿½s all.
"B" releases had the better FAST Ram controller, faster and allowed
128MB of RAM. Installation is is all the same.

> have boards).

The point how CENTEK sayï¿½d they only sell CT2 with installation.
MOST of the CT2 "A" boards installed by the owner.

A lot of machines form here, after self installation, was on the road
to CENTEK i knew. Most of them are back without orignal CPU.

Maybee a point of trouble AND a point of no return..

But 85% of them all had trouble with the software setup.

Main trouble: hard drives doasnï¿½t respond (scsi and ide)
: forgot to patch MagiC
: forgot to instal DSP patch (hard or soft)

In my opinion, comes all from the very very smal manual.

> Most of the ct2 owners I know have problems, some of them soo serious they

> install it.

Itï¿½s a great expansion. Use 14MB ST-RAM and 32Mb EDO Ram on CT2, works
fine anytime for any software i have. No trouble.

(Self installed unit) .) (sure, thatï¿½s not the point, only a joke)

You can try zorg. But if the prg has some of its parts on a bad sector
then you're out of luck. Zorg can be found on
ftp://ftp.lip6.fr/pub/Atari

Hello! I have the same problem with true paint on my Nemesized Falcon. I
can't use the colour wheel! I can't remember if it was TC only or not.

> Hopefully there's a simple fix for this that I'm over-looking as I use
> True Paint alot.

I don't. True Image is much better! and Photoline is so much better!!
PixArt is very good also, Digital Lab too. True paint has a good price though! :-)

yet I wish I had a CT2, for that extra RAM. Apex media is OK with Nemesis.
I just wish I could get the upgrade to 2.41. :-(
what is the big difference (if you remember) between 2 and 2.4? Is it
worth it? Well, even if it was I couldn't get it so maybe don't tell me,
I don't want to be sad.

TOS 4.04 = 1Gb maxium size per Partition.
12 GB hard drive = 12 partitions, each 1Gb as example.

Partition size had nothing to do with the size od the hard drive

You can wait Aniplayer 2.08 in 3 weeks, full D2D is possible
on normal FALCON with lot of files. I hope always full D2D for
all files with a direct output from DSP (now I use port host),
it's same problem on TT with a StarTrack-DSP.
With a CT2B it's not a problem :-) since one month.
Without DSP, full D2D in only possible on an Hades 060.

Another project is FalcAMP from ST-Ghost/Sector-One and Splash:

>Does anyone know if this formerly standard ST hard drive will quit
>working or do something funny when Y2K hits?

If the drive has been sitting in your closet for years, then the
battery is probably already dead on the clock. The only possibility of
you having a problem with the drivers (something I doubt would happen)
would only occur if the clock was still working. More than likely if you
ever boot the drive up the clock will say it's 1985 or whatever the
default time was on the ST, I frankly don't remember anymore.

>
>I ask, because I no longer have my ST, but have many files stored on

>

They can't be damaged if the drive isn't turned on. If at
sometime in the future you want to start this drive up, and are fearful of
a y2k bug. Simply open the case and remove the battery for the clock.
There isno mistaking it. Looks like an oversized watch battery. Without
a battery (dead battery or no battery), the controller will have no way of
knowing what year it is.

>So, to reiterate, does anyone know if Y2K will conflict with/screw up
>(because of the internal drive) the files on my Seagate/ICD hard drive?
>Any help would be much appreciated. And if there's anyone in the New
>York area who has an ST running and would be willing to allow me to hook

>to you.
>

That's always an option, but I don't think you need to worry. I'd
help you but I live about 10 hours away from NYC, even taking the speed
limit libarally.

I'd say don't worry about it. The battery was probably dead years
ago. Even good batteries of that style don't last much beyond 7 years.

I have an Epson ES1200 that can be connected to the Falcon by either parallel or SCSI using GTLOOK s/w (older version). From what everyone else says, other software dosen't work with the Falcon parallel port.

Aside from Aixit's Magnum RAM board for the Falcon, are there any other FastRAM boards out there? I had no idea such a board would be so costly.. even in the Falcon market!

The CT2A has a FULL 32-bit expansion bus. Since the CT2 itself is a full 32-bit computer (CPU, FPU and RAM) it would have been stupid to strangle it with a half-width bus like on the Falcon motherboard/expansion bus.

Technical specifications of the CT2A 32-bit expansion bus were available on-line for all to use. Only one serious design was submitted to Centek, and it was never finished.

Out of 92 CT2A sold, not a single full-production expansion card was completed by any of the users, to take advantage of the full 32 bits of this bus. Also, no developers outside the CT2A user base expressed an interest in designing new expansion cards for this 32-bit bus. I think those are good enough reasons to drop it.

As for legacy support - what other devices have been made to use the Falcon 16-bit expansion bus? RAM cards (forget it, CT2 has superior 32-bit fast RAM), 286 PC cards (anyone still seriously using one of these?), some graphics card bridges and video digitisers.

If you really want to continue using these, it's possible by soldering rows of pin extensions onto the old card and plug the CT2 on top. CT2's PCB is a really compact design intended to fit into a standard Falcon case, so even the expansion bus on the CT2A had to be re-arranged in such a way to fit onto the board, which unfortunately makes it impossible to fit other cards on top of the CT2 anyway.

Funny, I have the atari adaptor for the RGB/MONO <> falcon screen. It used
to work with the SM124, but not anymore with the ct2 fitted. Although the
screen DOES work on the megaste.

> Although Centek prepares its new surprise - Phenix computer - this accelerator card is a worthy contribution to remaining Atari enthusiasts

"A new suprise", pretty good one. I can not call a 2 year old surprise a
surprised.

>
>
> Advantages:
> - speed and screen resolution increase
yup
> - compatibility
yup
> - stability

hm yes and no. I have the impression that the compatibility is excellent,
BUT it weakens the already old falcons (what I think). Mine is probably 5
or 6 years, and it is just disintegrating itself step by step since I put
the ct2. Now I think the scsi chip is going really bad.

> - support (installation and there is special software written for it in order to use its capabilities)
support, i don't know, I guess you are luckier than I.

>
> Flaws:
> - absence of extension slot on rev. B
who cares? there are like 5% of the falcon user really using these
extensions. And if you REALLY still need it, there are workaround.
That was a good choice from centek.

> - adjustments to be made when CT2 is installed into Falcon's case (CPU fan and SIMM module are too close to keyboard, so

Hi there,

This is probably one for Uwe Seimet to answer...

I'm looking to get HD-driver latest version from
System Solutions. I need to know if an IDE LS-120
superdrive will be able to work as a floppy drive
on my Falcon030? My Epson SMD300 floppy disk is a
bit suspect currently, so I thought if I'm going to
replace it my not get an LS-120 and get 120MB disks
as well!! I've got a spare IDE connector on the IDE
bus so its there to use (already have Quantum Fireball
1280A hard disk on IDE0, will use LS-120 as a slave
on IDE1...)

Is this possible to do?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

Yes, this will work though I don't recommend having the LS-120 as the
only "floppy" drive, i. e. replacing the built-in drive. In case
something goes wrong and HDDRIVER won't boot anymore you won't be able
to access floppy disks at all since HDDRIVER is required for everything
regarding the LS-120, i. e. also for reading/writing floppy disks.
Also note that the LS-120 doesn't like any other floppy disk format than
the usual formats with 9 sectors per track (DD) and 18 sectors per track
(HD). Everything else won't work.

The main pro for the Milan is obviously the price: it's much cheaper.
On the other hand many Milans tend to be pretty unstable (hardware-
wise) while others run perfect. It's now my second Milan after the
first one was so unstable that I could hardly use it. The second one
still likes to crash but is a bit more stable.
So definately wait for the Milan II because it seems that the new
manufacturers are more professional than the old ones.

Hades was a nice machine but it's only a question of time until the
machine is finally dropped.

Greetings,
Matt.

Message-ID: <80u3ev$p2t$1@nnrp02.primenet.com>
Source record: 70432

This game is rare. This was released in 1998 by rebelsoft and contains some of the best graphics and video ever for a Falcon game. (from back of box) "A breathtaking space simulation, accurate in every detail!" If you collect Falcon games and don't have it, you probably will want it. Game can be run from hard drive but you still need the disks. The disks are massively copy protected. This was $40 when it came out. Now you would be lucky to find it at any price. If you want it, I will sell it for $33 shipped, paid first with a money order. See my Ebay rating under my nick "Satcom2". Everything is in mint condition. E-mail me if interested. Thanks! -Satcom2

>files. If you have done this I would be interested in knowing how it was
>done.
I have no direct answer to your question BUT:
Family Tree is still being worked on, and I am currently testing the first betas of a "multimedia" version. It will allow you to enter Links in the Further notes, and to associate external programs to extensions, the same way as it is done in CAB for instance. This way, you will be able to add whatever you fancy (videos, images, WP documents, etc.). AFAIK, it will work in single TOS as well as under a multitasking environment.

I would normally not speak on behalf of a programmer (I am the French translator of Family Tree), but as I know Ian Baker (the author) does not follow the newsgroups, I tought you would appreciate the news, and that Ian will not mind.

>As it is I am very happy the prg, and it works on everything I have
>from my ST TOS 1.0 to a Falcon.
Yes, that's one of the qualities I appreciate in Family Tree.

The PC will *not* read floppies that are formated on the Atari. However, the Atari
can read and write floppies that are formated on the PC. I had a little utility
once that would *fix* Atari formated floppies, but the fix *must* be made before
any files are saved to the floppy. (Linux may *not* have the problem about Atari
formated floppies. My Mac seems to have *no* touble with reading them.

The sinclap random string generator has a built-in spell
checker, to give the illusion of intelligence. Unfortunately,
it lacks the ability to string correctly-spelt words together
into anything but half-witted nonsense.

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

(Update: 11/18/99) I've just added more 8 Bit Software to my Catalog. Programming Languages & DOS's from OSS, HOFACKER, Alpha and even Atari MicroSoft BASIC & Atari LOGO. Lots of Utilities & Copiers like Chipmunk and Impersonator. My Catalog is growing by leaps & bounds.

(Update: 11/04/99) I've just added a bunch of Titles to my Atari 8 Bit SoftWare Catalogs. All Games!!! A number of them are UnOpened! Many for only $5 a pop! And I went through my Catalog and did some adjusting of prices. Right now my 8 Bit SoftWare Catalog has a bigger Byte count than ever.

Atarians Unite! Are you pining for the days of a simpler Computer? Do you miss Arcade Classics like Asteroids, BattleZone, Joust, Missile Command, Robotron 2084 and my favourite Star Raiders! Well Bravo Sierra Computers has them. Are you wandering, wandering in the desert of violent video games. Games too violent for children? With Blood & gore? Two companions of youth nowadays. Especially those you hear about in the news who kill fellow students at school. If your preferences for games lean more towards family friendly. Like it used to be. Try some of my Atari Arcade classics. I have oodles of Atari SoftWare! As well as truckloads of Atari HardWare. And Libraries of Atari Books. Reference material and things you thought you'd never find! So come check it out. The best of Classic Atari 8 Bit & Atari ST. E-Mail me at

e-mail: atari@benjamin.net

Or call me anytime at (503)256-9974 to talk to a warm, friendly, people person! Your more likely to reach me from 3 PM-3 AM Pacific Standard time. And thats most likely the times I can return calls. I'm perfectly willing to call you, on my own dime to answer your questions. I'm a people person and those who have dealt with me will find me patient, a good listener and even a good teacher. So if you can't call me Today? Call me Tonight!

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact check it regularly as my Catalogs are updated regularly. I have 6 different Catalogs, and my SoftWare Catalogs are my

largest. They have the biggest Byte Count. And remember if you can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, December 9th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get together with other Atarians. Make friends, meet new people, maybe find an old friend. Eat Pizza, drink Pop or Beer in a decorative atmosphere. Bring your family to a family friendly place. For more info try:

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President Ben Smith at (503)256-9974 See you there!

Please direct all replies through E-Mail at bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I don't regularly check NewsGroups.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, December 9th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get together with other Atarians. Make friends, meet new people, maybe find an old friend. Eat Pizza, drink Pop or Beer in a decorative atmosphere. Bring your family to a family friendly place. For more info try:

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President Ben Smith at (503)256-9974 See you there!

From: Robert Goldsmith <r.goldsmith-csai97@cs.bham.ac.uk>
Message-ID: <3833EB11.A1AF8A31@cs.bham.ac.uk>
Source record: 70306

Coaster wrote:

> I'll try STiNG and see if I have better luck.

Contrary to some of the postings here, Stik 1 (the
orriginal, released version) does NOT support PPP. It is a
simple SLIP only setup. However, as has been mentioned,
Sting and Stik2 (currently in Beta) are capable of PPP and
PAP (any news on CHAP anyone ?).

For help in setting good values with the latest version of
Sting (there have been some big changes) you may wish to
download the generic Zetnet default.cfg file (even if you
are not on Zetnet) at:

http://www.the-asylum.zetnet.co.uk/zetnet/bin/sting/newdefault.cfg

It has the best suggested settings for items such as memory,
MTU and others.

I hope this helps. If you have any other questions, don't
hesitate to mail me :)

broncos@primenet.com wrote:
>
> What is the difference in SCSI, ULTRA SCSI, ULTRA WIDE, ULTRA 2 WIDE LVD SCSI
> drives.

I have little idea about it all but afaik it goes something
like this ...

SCSI is the basic version. SCSII (SCSI 2) is 16 bit as
apposed to the 8 bits of SCSI and so goes faster. It is SCSI
compatable.

'Ultra' and 'Wide' seem to refer to both extra lines (maybe
32 bit - but I thought that was just SCSII 3) and faster
than standard transfer rates (not SCSII 2 compatable...).

This means that only SCSI and SCSI 2 devices are usable on a
Falcon without an adapter. However, all these newer drives
should be backwards compatable so maybe with an adapter
cable, a switch on the drive or something it will still be
possible to use them.

Hope this helps

Robert Goldsmith

>can find one anywhere

Magic PC doesn't require a TOS image (at least the demo version
didn't). It is a complete re-write of TOS, so it doesn't use TOS at
all, either on PC, Mac, or even Atari.

2486. SCSI on a Falcon

Newsgroup: comp.sys.atari.st
Date: 1999-11-18 00:00:00 UTC
From: broncos@primenet.com
Message-ID: <80vu9p$ab3$1@nnrp03.primenet.com>
Source record: 70372

What is the difference in SCSI, ULTRA SCSI, ULTRA WIDE, ULTRA 2 WIDE LVD SCSI drives. I recently bought a mac ultra scsi orb drive and it would not work with AHDI on my falcon. Now when I plug in my EZ135 drive ahdi sees it to format it. When I plug in the ORB drive AHDI does not see it.
The only thing I could get the FAlcon to do is scan at bootup using cbhd.prg in the auto folder.
Can the Falcon use any of these scsi drives or is there a incompatibility? What are my limitations and What do I need to ask for when purchasing a external scsi drive?

You guys are aware that Falcons come with all languages on the EEPROM,
right?
You simply need to change the language using BootConf from Uwe Seimet. If
you
want the program, email me. However, on a Falcon, TOS is in german,
english, swiss
german, french, and others I can't think of at the moment, all on the same
chip. Don't
forget to change the keyboard layout as well though. :)

Hi folks

I recently came across an interesting French programme called Wensuite on an FTP site. It's an ambitious web/news/mail client but as the whole thing (including docs) is in French, it is about as clear as mud in some important places.

Does anyone know anything about this and how I can get it running ok under STing 1.15 on a STE 1040? STing connects ok to my provider but Wensuite doesn't seem to send or receive any data across the net. Has anyone used it successfully and if so what's it like?

Please feel free to mail me on sonik@ukf.net with any info and thanks very much.

Cheers :)

TOS2WIN is definitly the fastest TOS emulator for Windows.
It doesn't need a TOS image and use Windows gdi instead of the Atari vdi,
but works only with well-written GEM-based software.
It can use custom graphic modes, colors... You can find a demo version
(unfortunately limited to monochrom) at www.aixit.com

you're right about MagiC PC not requiring a TOS image to run, however
it does have an option for loading a TOS image so that you can run some
games and demoes with it.

Filled polygons in this case includes circles, pies and thick lines, which
are also significantly faster than before.

I'll post some numbers from VDIBench soon, so that people can see just
how fast fVDI/mach64(RageII) really is. ;-)

>>of fVDI and the RageII driver.
>
>Umm...0.94B I believe...dunno about the RageII driver though...I'll go look

Well, I usually don't increase the version numbers of my software all that
often. You have to look at the file dates.

Anyway, it certainly is time to bumb the version up to 0.95 (or even 0.96),
but I've always wanted the next one to be a full release. The only
non-beta version is still v0.85, which is almost a year and a half old...
Unfortunately, the normal Atari bitplane drivers haven't been updated
for quite some time, and I never seem to get around to that. :-(

>at your FTP site... Scooter won't start in a res with more than 256
>colours...you get a message from the software saying to switch to 256 or
>lower...runs fine at 1280x1024x256....

If you want, I could try 'faking' 256 colours so that you don't need to
switch modes to run that program. Depending on the reasons for Scooter's
dislike of 16 bit mode, it might work, but then again it might well cause
crashes or a corrupt screen image.

Sure, with the new motorcycles and house, Christmas will only be
observed this jear:) Send sister-in-law Global Priority for a vacation
over here :) I will email my address to you from home. I still owe you
some video tape of life in the desert! I have a good sand storm on tape
for you:). Jason is getting an "A" in German this year, much better the
second time. Now he can help out with software when I need it. We need
to buy a German "technical dictionary".

Mike

if you read the original question it is to emulate an ST, Magic PC does NOT
emulate an ST but as you say replaces tos with the magic OS, so to emulate
an ST you do need a TOS image

Eh? What?? Have you ever used JScript in ASP-documents? It has absolutely
nothing to do with the browser, while *client-side* Javascripts are very
dependant on the browser.

> enviroments where you know the browser being used. It certainly is not
> in wide use on the internet.. in fact server side Javascript is in
> very little use on the internet.

You see it all the time, many of the real large sites (web-shops etc.) use
Microsoft Internet Information Server with either JScript or VBScript to
communicate with their databases.

Indeed. There's a lot of interesting stuff in Windows, ActiveX scripting
is one of them. This allows you to use virtually any scripting-language
you like, the two most popular are JScript (Microsoft's implementation of
JavaScript) and VBScript.

I would like to see something similar for MiNT and MagiC, but we need a
proper object-model first.

They're virtually identical, atleast today.

> Client side Javascript is simple to impliment on any browser that
> supports javascript while serverside javascript is not simple to
> support out there on the www as easilly and as such is little used.

It's not more difficult to support than PHP or even good old CGI, it all
depends on which server you run.

>>You see it all the time, many of the real large sites (web-shops etc.) use
>>Microsoft Internet Information Server with either JScript or VBScript to
>>communicate with their databases.

> VB Script only works in MIE . There is a netscape plugin to allow use

And? How many MSIE-servers do you see on the net? ;-) Server-side
scripting is totally invisible for the client, hence entirely independent
of the browser.

> of VB but last I saw was commercial and thus also not widely used and
> I say again..JScript is NOT Javascript and thus my original statements

So you're writing "Javascripts" that will only run on Netscape Navigator?
If it works on MSIE, you have written a JScript...

> There is a Javascript FAQ that should be easy to find. there you will
> learn the differences :)

I know the difference, and I also know that JScript and JavaScript are
currently very compatible.

Since you will not be doing anything besides text with WP4.1, the DJ,
DJ+, or DJ500 drivers should all work fine. I can't recall which of
these I'm using with my DJ500, but the 500 series is pretty tolerant of
"cousin" drivers.

2525. MIME decoding?

Newsgroup: comp.sys.atari.st
Date: 1999-11-19 00:00:00 UTC
From: maxilys@normandnet.fr
Message-ID: <99ea30ad90B802A1.46@nest.ftn>
Source record: 70261

Hi everybody,

Does somebody have at reach of hand the sources of a routine for MIME (Base64) decoding?

I'm looking for something simple in C or Pascal. I don't need routines able to handle splitted files, MIME nested up to 1000 levels, MD5 (what that?) and such complicated things. I just want to be able to take a Base64-encoded text block and to turn it into a binary block.

Thanks for all,

Would this be because that CAB OVL doesn't support SSL? That has nothing
to do with server side scripting being dependent on the WWW browser.

: PHP is script in the HTML thus requires the browser to support it
: surely?

No. PHP is evaluated by the WWW server itself or a CGI program running on
the server. The WWW browser doesn't know that PHP is actually being used.

FA: Atari Falcon computer, 14 megs RAM, external keyboard modification
and clock patch done by ATY computer on Oakland, CA. This machine was
in perfect working condition last time I used it. I have original
packaging and all or most of the original floppies. No hard drive
included. I also have the original 4 meg RAM card that will be
included.

This machine has never been modified or overclocked except for the
keyboard modification. I have used this mainly for digital recording
using Cubase Audio Falcon.

Weird. I've used disks formatted by both TOS 1.62 and MagiC 5.03 on my STE
with no trouble on my PC under both Win95 and Win98SE (FAT32 on both, but
AIUI this doesn't affect floppies anyway, only the HD). Only trouble I had
was the problem of Windows writing VFAT stuff to the floppies which rendered
them unusable. I had no trouble getting it to read the disks though.

Maybe I'm just lucky!

AIUI (and I could well be wrong) it is a means whereby clients can control
the dialer, eg call it to set up a connection if it's not connected when a
link is clicked in a browser etc. AFAIK nothing so far uses this facility
(again I could easily be wrong).

>
> Best Wishes,
>
> Mikey

Well Mikey I have been trying to get the Falcon back on-line to test new and upcoming features of my site which could be of great use to Atari users. Features like web based real time chat that does not use java or need an IRC client. Free personal homepages which can be set up from even a floppy based ST and a lot more. From a business standpoint, if the browser or platform is not capable of purchasing from the site, the effort of catering to these users is not worth the effort. However I feel that all the additional features should be accessible to all regardless of their browsers ability to conduct transactions.

It's people like you who make the effort of attempting to cater to Atari users unpleasant.

As far as your respect, I neither need it or desire it.

One last question. Do you kiss your mother with a mouth like that? You shoul be ashamed to have to resort to cursing to get a point accross.

What browser support javascript for the atari? I have been away from the Atari "scene" for a few months and the last I heard Draconis/Adamas was implementing it. A few weeks back i tried to go to their site but got a 404. I tried several times, but still got the 404.

While javascript or client side processing may never be practical for manipulating large databases or be trusted with sensitive data, javascript is becoming increasingly popular for simple tasks which were formerly accom,plished through CGI scripts. Javascript was designed to work specifically with HTML and as such is perfect for accessing HTML elements. in particular is javascripts ability to interact with forms. The other attractive ability of client side javascript is it's ability to write documents on the fly, and to write to a document. This is especially uselfull for parts of a site which are repeated throughout the entire site like the navigation system.

There are over 300,000,000 web pages out there many of them with the same navigation bar throughout thousands of pages. having one external file which writes the navbar to each page is a tremendous savings of resources. Many developers are afraid to do this as well as embrace CSS for fear of alienating users, or making the site inaccesible.

What it really comes down to is useing the best tool for the job.

Hello "Thierry,

s> TOS2WIN is definitly the fastest TOS emulator for Windows.
Definitly not! =:-o

s> It doesn't need a TOS image and use Windows gdi instead of the Atari
vdi,
Same as MagiC PC with NVDI. But MagiC PC 6.1 itself is *always a lot*
faster
than TOS2Win, running tasks in half the time that TOS2Win needs.

Short example from my daily work: A database converter of mine (reading
import file, analyzing entries, adding new and rearranging old information

due to analyzation process and writing different sorted export files)
running
2 min 24 sec with TOS2Win 2.0 demo and doing the same in 1 min 06 sec with

MagiC PC 6.1 (even although MagiC PC 6.1 is optimized for PII and not for
the
K6 I have here - on a similar PII MagiC PC seems to be even faster).

Long ago I had "high hopes" to TOS2Win, but even now (regarding to the
available demo 2.0 - 2.5 is available with some fixes) it should be more
stable, more compatible, much faster - at least since the release of MagiC
PC
6.1, former versions of MagiC had nearly the same speed than TOS2Win - and

should handle long filenames ...

BTW: Also the STEmulator does use Windows GDI and offers nearly the same
speed than TOS2Win (don't know exactly). Although the support of long
filenames could be much better, it does not seem to have the other
mentioned
flaws of TOS2Win, is cheaper and still being developed (never heard of a
new
TOS2Win version for a long time - especially an update regarding long
filenames) ...

Greetings, Oliver

For the sake of cheapness it is, but otherwise no.

> I have a 2.5 6.4Gig IDE internal hard drive thats mounted
>in the stock location using the stock drive brackets. I did have to

As you say there is a need for a little repositioning, but I also had
to use some plastic washers to insulate the drive cradle from the
motherboard.

>problems. The only extra Fan that I have to use is just sitting over
>the powersupply outside the case. I cut my top metal shielding

I've used some hot-melt glue to fix a fan inside the case, just above
the PSU.

>The keyboard doesn't sit exactly straight, it's off abit but no
>big deal.

My only problem in this area is that the SIMM I used isn't a low
profile one, so I've had to use some bits of plastic to space the
keyboard up a little, and some cut-down grommets to extend the
length of the top case pillars. I've ordered one of Mario's
keyboard interfaces, so I'll be able to make a neat job of putting
the whole thing into a Desktopper case that I have knocking about.

Very nice over view of the CT2.

However you did say that a 2.5 to 3.5 IDE adapter is a must and that's really not true. I have a 2.5 6.4Gig IDE internal hard drive thats mounted in the stock location using the stock drive brackets. I did have to slide the drive back toward the back of the original case. But there is room to do this without problems.

I'm still using my CT2 v.B in the Stock Standard Falcon Case without any problems. The only extra Fan that I have to use is just sitting over the powersupply outside the case. I cut my top metal shielding into and am still using the lower part towards the keyboard. The rest of the top shielding that covered the PS, hard drive, and etc was removed.

The keyboard doesn't sit exactly straight, it's off abit but no big deal. Soon I'm installing it all into the MegaSTE Tower Case I have. There will be lots more room for aftermarket cards, hard drives, and etc.

Also, you mention that upto 256 Megs of Memory can be used on the B version. Is that true?? I've heard only up to 128 Megs which isn't bad at all but 256 Megs would be really Cool!

I do or did use the 286 Falcon Speed board. May sound like a
waste of time, but I find that little Gem very useful.
Depends on what you run on it. ;)

And of course the Expose. What I'd like to do is use both the
Expose and FalconSpeed board along with the CT2 v.B if possible.
Not sure if that would work or not but I'm going to try it out. :)

Shouldn't the Eclipse also work with the CT2 v.B?

|image. How would I go about doing this?

It's easy with the right tools. A program comes with Gemulator to do
it. I don't remember the name. I think there is a demo of Gemulator
somewhere. Try the FaST Club site.

Javascript and CSS must be incorporated into Atari browsers. Much of the slowdown with web pages on atari computers is the graphic files and the tables being rendered. With javascript and CSS effects which would take 10k of code and images can be accomplished with 1k of code. CSS allows you to place an image or area of text anywhere on the screen making tables and spacer images unneeded.

Javascript is slowly replacing server side processing (ie CGI) This reduces bandwith, and enables faster processing of data.

Both of these "modern features" make the internet a faster and better place.

One thing about the atari community is although it may take time for new technologies to appear on the platform, they eventually get implemented. There will eventually be CSS and javascript support on the Atari, and more importantly it will comply with published standards.

I have seen the Atari community overcome so many "impossible" feats. I have seen programs which seem to defy all capabailities of the hardware.

There is a serious flaw in your reasoning. I have been an Atari user since 1988 and own and use both a F030 as well as a 1040 STe, an A2000 and a 400mhz pentium.

The Atari computer using AHDI should have been able to format and partition the drive, when I bought the computer, I paid for this feature, unfortunately AHDI was not up to the task and sent me into a complete circle of formatting and being told to reformat before I could partition the drive. My ICD utilities which came along with my Link for my ST also could not do the job because ICD saw in their wisdom that their utility should be crippled for use only with the link or their host adapter even though I paid for the product.

I did not mention needing a bunch of disk utilities for my computer i said I had an urgent need to format a hard drive which SHOULD be part of the OS's capabilities. When I use a demo thinking it may solve my immediate problem it makes me want to purchase the full product for the rest of the features. Wading through a bunch of menus to eventually be told that the feature is disabled really pissed me off. More importantly, it left me still without a hard drive working on my F030.

Maybe I should have run around the corner to the local CompUSA to purchase Norton Utilities for the F030. Oh I forgot no one at CompUSA even knows what a F030 is amd there is no Norton utilities for the atari.

Luckily I did find the Cecile program which allowed me to format and partition my drive. Now since you obviously do not know the answer to my question regarding data integrity with Cecile, maybe you could find some personal integrity and not make assumptions about people you do not know. Ignorance is lack of knowledge, and you my friend are very IGNORANT.

There's a program ROMIMAGE.TOS in the archive of TOSbox which does this. You
may find it seperately if you root around in the Utilities section of a good
ftp site.

Since I would be purchasing something from a different country, I would expect to know that the product works and not have to deal with buying something which may not be what I need. I have had one bad experince with HDDriver in the past as I was checking out a previous version to see if I could use my jazz drive as 1 partition. I installed the driver and rebooted and my entire C: drive disappeared, luckily I noticed there were no files on C: before i saved anything to that partition or I would have probably lost the entire parttition.

Anyway would I be better off repartitioning this drive to 500 meg partitions? And why wouldn't AHDI partition this drive?

Hi Uwe,

I am sure you have a fine program, but sending a potential user/customer into a bunch of submenus to only be told that the feature is disabled is like having a girl take you home, strip down, sit on your lap and then 10 minutes later say "sorry I gotta go."

I understand as a commercial product you cannot have people using your hardwork for free, but there are many ways to make a demo limited use such as letting the program only be used a few times and then locking the features up. For me to purchase something in another country which I have a better shot at seeing Elvis than getting my money back if the program doesn't work properly, is totally out of the question.

15 years of using computers has taught me several valuable lessons the most important is to try before I buy.

It's better to have a partially functioning demo sitting on someones computer with a reminder to purchase the product, than to have a downloaded demo go straght to the trash can because it has no use. if I could have formated and partitioned the drive with HDDriver, I would see your program name on my screen every time I booted up and when It came time to defrag, or zero a partition then I would have to buy the full product. You have the only viable hard drive program out there and it should be on every atari out there in either fully purchased form, or a limited useable form. When i boot the Falcon up later, I should see a reminder to purchase the full version of HDDriver, but I will see some crazy purple flash and gibberish and then my desktop.

Body handling: HTML body converted to readable text

Actually using CSS and Javascript enhance sites, and make them faster.
Properly designed pages comply with the W3C recomendations which is to use CSS
as much as possible. CSS enable site developers to control the format of the
whole site with a single file. add up all the tags on the internet, and the accompanying

plus all the variations on over 200 million websites and
replace them with a simple
tag. The savings on one page are minimal, but
combined there is a tremendous saving in bandwith and server storage space.

The increased use of javascript is enabling quicker response times witth
functions which were formerly done with CGI. With server side processing, the
form has to be sent from the browser to the server and a response has to be
generated an returned. By utilizing Javascript, the same form can be processed
and a response generated before the results are sent to the server. This cuts
server access down and reduces the load making the servers quicker and making
the internet quicker.

Properly written web pages have an "alt" attribute in the tag which is
displayed if the browser doesn't support images.

While I am very guilty of overusing CSS and javascript, I still try to keep all
the users out ther in mind. If you think that Atari users are ignored, feel
bad for the web TV users, I have yet to see a site which displays correctly on
webTV, and they are the 6th largest ISP.

Go to "The Little Green Desktop" at http://www.lgd.fatal-design.com/

They have PaCifiST (DOS based emulator) and WinSTon, a windows one.

Both are pretty good, but both need a ROM image, but don't depair. These are also available for download from this site, in various versions and languages. You will also find plenty of downloadable game disks.

Have fun!

Adrian

Unfortunately it's not that simple, if the JS-engine doesn't have
access to the objects in the document and/or frameset it is a part of,
it's virtually useless. I can't see how this can be done without
rewriting large parts of CAB.

Well, I won't say that - server side processing is getting more popular
because server side languages are in some parts much more powerful than
JavaScript (e.g. PHP working with data bases). JS is fine for other
purposes.

Greetings Atari Folks,

Was wondering if anyone is currently working on any new Atari related
CDs with the intent to market them for sale?

phantomm@kih.net

Funny you should mention that! Bob Buman of the Spectrum Atari
Group of Erie has put to gether a "totally Atari" CD-ROM to commemorate
the 15th anniversary of our user group. It features some of the history
of our club, but also includes much, much more. Both our 8-bit and ST PD
libraries are on it along with Atari commercials, interviews,
software, etc. It's sort of a walk down memory lane!

The SAGE Commemorative CD-ROM is scheduled for release on December
4th which our anniversary date. It will cost about $10 plus shipping.
Watch for a formal announcement with more details and exact price (once we
find the cheapest shipping method!) in about a week.

Dennis McGuire
President/Sysop
Spectrum Atari Group of Erie

400mhz
>pentium.

Ok, I have been an Atari user since 1988 as well, have an A2000/040 and a PIII 500. I have three Falcons, one fitted with an Afterburner, one with a Might Sonic, and my sons will have a CT2B installed soon. Most of my ST's have been packed away for quite some time, I have sold both of my TT's and Megas STE's. I still have a Sparrow packed away in a box. We have two Jaguars, and a Lynx. I don't care to talk about Macs.
So we both know the Atari market and what utilites came with the machines back in 1992.
>
>The Atari computer using AHDI should have been able to format and
partition the
>drive, when I bought the computer, I paid for this feature,
unfortunately AHDI
>was not up to the task and sent me into a complete circle of formatting
and
>being told to reformat before I could partition the drive.

AHDI was not written to take modern hard disk into account. Nor was DOS, Windows 3.0 or Norton Utilites back then. All have to be upgraded to function propery with the latest hardware. When Apple went to O/S 8, I lost compatibility with a version of Norton Utilites. If I wanted a

working version, I would have to pay. There was no free demo to let me continue using the package. Why should AHDI, released in 92, be compatible with hardware manufactured in 1999? In 1992 the most common drive was around 1.2 gig. AHDI will format Quantum 540's, Conner 1 gig, Fujitsu 1 gig's and may others as well as Syquest EZ disk. It does have problems with some drives over 1 gig. For an ST, it is a fine driver, especially if your just running TOS. It works quite well on the Falcon as well, unless you want to start connecting external devices and drives that were not taken into account at the time it was released. I think it forfills the obligation you seemed to be concerned about.

> My ICD utilities
>which came along with my Link for my ST also could not do the job because ICD
>saw in their wisdom that their utility should be crippled for use only with the
>link or their host adapter even though I paid for the product.

ICD Utilites is not cripple ware. The version that came with the Link only works if the device is connected. If you wanted the stand alone version, called ICD Pro, then that package was available as well. I suppose you get pissed when your Mitsumi drivers don't work with your Plextor CD Drives? I have two Links, and also purchased ICD Pro for use with the Falcons early on. I was happy with the product. What is the problem here?
>
>I did not mention needing a bunch of disk utilities for my computer i said I had
>an urgent need to format a hard drive which SHOULD be part of the OS's
>capabilities.

I thought that you were an Atari user? Anyone with experience knows that TOS will not format a hard disk. Why do you think there was a market for packages like SCSI Tools, ICD Pro, HD Driver and the like? Even the Supra drivers are still available on Diamonds web site, but they will only work with the old Supra drives. Does that piss you off too?

> When I use a demo thinking it may solve my immediate problem it
>makes me want to purchase the full product for the rest of the features. Wading
>through a bunch of menus to eventually be told that the feature is disabled
>really pissed me off. More importantly, it left me still without a hard drive
>working on my F030.

I can't image it took you more than a few minutes to discover the limits of the demo. You went right to the feature you needed, correct? Wouldn't it have been easier to order HD Driver from Systems for Tomorrow and have an upto date package that would offer support for most any IDE or SCSI device you want to use with your Falcon? I guess if the demo worked, you would have gotten around to it.....

>
>Maybe I should have run around the corner to the local CompUSA to
purchase
>Norton Utilities for the F030. Oh I forgot no one at CompUSA even
knows what a
>F030 is amd there is no Norton utilities for the atari.

Kent, and many other mail order Atari business still exist, and will
ship a package to you in no time at all. If Uwe released a demo that
could perform the function you wished, what would become of the existing
Atari retail market that is left in the U.S. ?

>
>Luckily I did find the Cecile program which allowed me to format and
partition
>my drive. Now since you obviously do not know the answer to my
question
>regarding data integrity with Cecile,

What does the format of the drive have to do with data integrity?
Also, AFAIK, it depends on what version of TOS, Big Dos, HD Driver,
MiNT, MagiC your using that determines what partition size is "safe" for
your machine. I hope that with Cecile, you were allowed to partition
your disk larger than whatever setup your using allows and you loose a
shit load of data.

> maybe you could find some personal
>integrity and not make assumptions about people you do not know.
Ignorance is
>lack of knowledge, and you my friend are very IGNORANT.

Yea, well your a real fuc*ing asshole. Sell your Falcon and purchase
another new PC or Mac. Just because your an Atari user doesn't impress
me. It's the ones that contribute to keeping the platform alive that get
my respect.

Best Wishes,

Mikey

Hi,
sorry, but I think my reply to thank you all for your help (14th nov.)
wasn't sent correctly to the newsgroup. Thanks! (I hope this reaches you
this time ;-))

I tried to install STinG with downloaded files, but I don't know, which
files
I need in which directory (I can't read the HYP-Dokuments).

```
If anybody of you use STinG for E-Mail with a Floppy only, could you sent me
the files in the correct direktory (with correct INF.Files) as private mail
peter@isirider.de
or describe to me, which files in which directories I need and which
modifications in the INF, CFG or other files I have to do.
E.g the present error message I receive occures when I start from the floppy
(STinG in Auto Folder, dialer.ACC as accesory) is:
"Serial Driver not installed!"
```

I have here something from 1987 called DISKMOD.TOS. It is small.
It tells me: new sector 0 without damaging files on the
floppydisk.Making them IBM-compatible.

In how many threads do I have to repeat this:

CAB.OVL 1.8404 for MiNT-Net _DOES_ support SSL since two years.

PS: Olivier Booklage is currently gathering data to add SSL
support in his CAB.OVL for STiNG also.

It's a must in terms of getting the best performance.
3.5" drives walk all over 2.5" ones, and with an
accelerated IDE bus like you get with CT2, the
transfer rates are very good indeed.

I agree that client-side processing _does_ take some load off the
servers. The question is, is the difference in load substancial?
Are we really saving that much CPU power?

The same question can be asked about wether it's relevant to use
.shtml extensions to differenciate server-side include, nowadays.

In both cases, given the speed and processing capabilities of
recent CPU technology, I say it's not relevant anymore.

Atari Games for Sale !!!!!!!

E-mail : oscar@agra.globalnet.co.uk

Work in all ST/STFM/STE Machines.

NOTE : All prices (noted with the symbol #) are in UK pounds
NOTE : All games are original, NOT copies !

** OFFER : Buy #10 pounds worth of gear and get any single game FREE

List of Productivity Software/Hardware : (#7 each + shipping in pound sterling)
---
* STOS Maestro Plus (Hardware Sampling cartridge and software included)

List of Compilations :(#4 each game + shipping in pounds sterling)

** (ALL BOXED + MANUALS + ORIGINAL DISKS) **
* Giants
(includes Outrun, Gaunlet II, 1943 and Street Fighter)
* Quatro Sports
(includes BMX, Italia 90, Advanced Ski and Pro Tennis)

List of Games : (#3 each game + shipping in pound sterling)

(ALL BOXED + MANUALS + DISKS)

* Baal
* Batman
* Deja Vu
* Driller
* F-19 Stealth Fighter
* Falcon (Game + Mission Disk Vol 1)
* Galdregons Domain
* Ghouls 'n' Ghosts
* Gods
* Gold Rush
* Heimdall (1 Meg)
* Hook (1 Meg recommended)
* King's Quest II
* King's Quest III
* Quadralien
* Leader Board (Game + Tournament Disk Vol 1)
* Lotus Esprit Turbo Challenge 2
* Magic Pockets
* Midnight Resistance

* Midwinter
* Navy Seals
* Night Breed
* Operation Wolf
* Premier Manager 2
* Rick Dangerous
* Robinson's Request (1 Meg)
* Shadow of the Beast
* Sly Spy - Secret Agent
* Space Quest II
* Space Quest III
* Spy vs Spy (Artic Antics)
* The Quest for the Time Bird
* Transartica
* Uninvited
* Zool

List of Games : (#2 each game + shipping in pounds sterling)

(NOT BOXED ONLY ORIGINAL DISKS + MANUALS)

* Another World
* King's Quest IV
* Leisure Suit Larry II
* Leisure Suit Larry III
* Operation Stealth
* Police Quest II
* Secret of the Monkey Island
* Storm Master
* Street Fighter II
* The Godfather III (Action Game)

List of Games : (#1 each game + shipping in pounds sterling)

(NOT BOXED, (1)NO MANUALS, (2)ONLY ORIGINAL DISKS)
(1)Manuals are not really needed to play these games anyway
(2)Original Disks, we do not sell pirated software,so don't even ask.

* Alien Syndrome
* Crystals of Arborea
* Hard Drivin'
* Indiana Jones and the Last Crusade (Action Game)
* Oil Mania
* Panza Kick Boxing
* Rock 'n' Roll
* Silk Worm (Boxed but no manual)
* Spitting Image
* Strider
* Trinity
* Trivial Pursuit
* Wrestlemania

I seem to remember that the PC interprets one of the bytes in sector zero of the floppy differently. I think this byte is referred to as the media type.

IIRC Atari used the format as defined by Digital Research who wrote the original disk format. It was alleged that M$ got hold of the code when they bought the company that had written it for DR.

Anyway, if you use a disk editor to compare a disk formatted on a PC with one formatted on an early version of TOS there are very few differences. I used to edit the media type byte so that the PC could read it and it was still readable on the Atari. It's a long time since I did this as I later fitted TOS 2.06 to my ST and that wrote disks that were PC readable, as does FastCopy and most other software.

This is another case of M$ ignoring standards or getting something wrong and then it becomes industry standard.

Peter

Have a look at http://www.scsita.org/terms/SCSI_Overview.html

I printed this doc a while ago, it explains some of the terms
and how they are mis-used.

I don't know for sure if it will work on a TT, but I have an ST-MIDI 3 for auction right now on ebay.. it worked fine on my Falcon. BTW, this interface only works with MROS (Steinberg Cubase).

It will give you 3 extra outs and 1 extra input.

Well,

Tried STinG and system was hanging while loading the Auto Folder. Would
any CFG settings cause this?

Tried STiK2B and sames results as when I tried STiK1 for SLIP connections,
I connect but after that the clients seem lost and my ISP (interlog.com)
eventually disconnects me.

All I'm trying to do is Telnet to see if things are working and I just see
the occasional flicker of the SD and RD modem LEDs. Can someone please
email a client app to 'test' the connection?

Here is my system set up:

Mega ST2 w/2MB RAM
ROM v1.4
GEMDOS v0.15
GEM v1.40
NeoDesk v3.03
STiK2B

Has everyone had to tinker to get STiK and STinG to work? Or has someone
simply changed the username, password, DNS, etc. and have it work first
time?

Any TAF member reading this have Interlog as an ISP and connect
successfully with STiK or STinG?

I'm at a loss as to why something seemingly simple, refuses to work.

Thanks.

Ken

>Shiuming Lai

As for 3.5 IDE drives walking all over 2.5s...
That would depend on the drive as performance would vary from drive
to drive. 3.5 IDE drives are alot cheaper than 2.5 IDEs.
I chose the 2.5 mainly because of the size. If I wanted, I could still
fit another 2.5 IDE in my Stock Falcon Case even with the CT2B in there.
It would be alot harder to do that with a 3.5.

However I do get a big increase in speed/transfer rate and etc out
of my 2.5 IDE. I use Cecile in the Flash in Turbo Mode. I have used
it on the Boot Partition also in Turbo Mode.
I use HD Driver as my choice for Standard Falcon mode due to thats
what I used before the CT2B. I might would switch to Cecile for
Standard mode if I had all the Docs in English so I could better
understand what exactly is supported.
HD Driver works great however and I really don't see a need for
changing at this point.
Having Cecile in the Flash is a very good Idea in my opinion.

As you probably know there are 3 Speed settings for IDE drives to
allow compatibility with older slower drives. I use my 2.5 IDE set
to the Fastest Speed possible with no problems. Also I do not have
to use Wait States either. My IDE really gets a Big speed increase
with the CT2B. I'll have to check with the Cecile setup program and
see what the Transfer speed is, can't remember at the moment, but do
remember it was impressive to me and alot faster than the SCSI tranfer
rate.

As a example before CT2B, when downloading info for Web Pages in CAB,
I remember waiting for the info to get written to the drive, converted,
and displayed on the Monitor.

After CT2B, I find that its so fast, CAB is only waiting for the info
to come in. Web pages are darn near being instantly displayed in TC mode.
And would be if I could get a faster connection to the NET.
I'm running in 800x608 True Color with a Port speed of 115200, however

I'm only getting connected to my ISP at around 26400 Baud.
Even so, the CT2B makes it alot faster because my IDE, graphics and all
are greatly speeded up and Stable as my Falcon was when Stock.
No crashes, bombs or etc. Unless I run a program that I haven't before
and needs setup correctly for the Fastload bit/FastRam etc.
I ran a program the other night that bombed out, but didn't crash the
system. I just needed to turn the Fastload bit on and then it ran fine
in Turbo Mode.

And the key to Cab is running the right OVL for your setup.

The CT2B should increase the speed of any modern IDE drive and even some
that aren't modern, unless there is a compatibility problem with the
IDE. I hear that some of the older IDE won't work in Turbo Mode, Not
sure about any modern IDE drives.

If one had a graphics card along with the CT2B that handles the Video/
Graphics stuff as fast or faster than the CT2B does and would then
free up the Video/Graphics processing time of the CT2B, Wouldn't this
mean that the CT2B would run programs and etc even Faster???

Anyone know if the Eclipse or NOVA would work with the CT2B in this
way if one can get both boards connected together???

Unfortunately, whether we like it or not, and whether it is the best
way to do things or not, Javascript is the way the Net is going, and
nothing we can say here will change that. So we need to adapt our
software as quickly as possible to be able to keep our computers
viable as Internet machines rather than discussing whether or not
Javascript is good or evil. If we just sit here with browsers that
aren't fully HTML 4, Javascript, and CSS compatible and not
actively do something about it, we'll get buried too far behind the
Net's progress to catch up. I suggest either getting Alexander Clauss
to release his code to either ASH or to the general public and
updating it (as opposed to him not doing much with it), or getting
our butts in gear with developing these other browsers that are
honestly unusable at this point compared to CAB, which itself is
quickly falling behind in technology.

I was probably just incredibly lucky, but I didn't have to change anything to get STinG to work. I did end up tinkering to optimize MTU and such, but it did work for me right off. However... Things didn't work at all on the ISP I had before the one I have now. No matter what I did, nothing worked properly. This was using STiK. Another thing to consider, which I found out was true on my Falcon at least: The more software you load up the system with (AUTO/ACC/CPX) the less reliable your connection gets. I'm sure on an ST it's even worse. For me, it got to the point that CAB couldn't completely download ANYTHING without the connection freezing up or going incredibly slow (around 100-300 cps). This was solved by reducing my system to only the bare essentials and gradually experimenting with what I could and couldn't run along side STiNG.

I think it was a mistake. Centek's EDO controller
supports 128Mbyte per bank, hence Phenix 060 supporting
256Mbyte with two banks.

>As for 3.5 IDE drives walking all over 2.5s...
>That would depend on the drive as performance would vary from drive
>to drive.

If you take one example of each from the same time, the 3.5"
device will almost certainly outperform the 2.5" - I've done
lots of tests, and my own Falcon happens to have one of each.
I quickly found the 2.5" was no good for direct-to-disk audio
recording and playback, and it's a fairly modern drive as
well; a 1.2Gbyte from 1998 (I'm not talking about the Atari
factory-fitted drive...) so I added a 3.5" drive. Now I have
a CT2, I get correspondingly higher performance from both
drives (can even do audio on the 2.5"), but the 3.5" still
beats the 2.5" hands down.

2.5" drives are designed for mobile storage applications,
like notebook computers. There are inevitable compromises
in the smaller form factor and portability requirements,
power consumption being one of the most important. Higher
spindle speed means more power consumption and therefore
shorter battery life (sure, in a 2.5" drive there is also
less platter mass to move but there are other reasons, too)

3.5" drives can outperform 2.5" drives through parallelism,
simply due to being physically larger. Using the additional
space, it's possible to stack more platters, so even with
the same areal density and surface-to-head speed (giving
equal transfer rate per head), the drive with more platters
could transfer more data in the same time.

>3.5 IDE drives are alot cheaper than 2.5 IDEs.

Sure, but I think the gentleman was saying (really) that
a 3.5" drive is essential to maximise the benefit of having
a CT2.

>However I do get a big increase in speed/transfer rate and etc out
>of my 2.5 IDE. I use Cecile in the Flash in Turbo Mode. I have used

I've used HD Driver from 7.6x on CT2 with no problems.
The only thing I had to do since installing CT2 is shorten
the IDE cable, since there was a lot of slack between
connections, and that becomes a problem when you accelerate
the signals.

Really, how much extra CPU time on the server does it take to validate the data compared to what ever processing is subsequently done on that data? 1%? 0.1%? Does this miniscule saving in CPU time on the server actually outweigh the extra CPU time required to send the Javascript validation code to the client?

Or do you mean that time will be saved when the user does enter invalid data, because the form will not be submitted? If a significant amount of submissions contain invalid data I would suggest this is better solved by improving documentation so that users submit valid data in the first place.

Read the pppd manual page. It's not very difficult, you probably just need
to run pppd on both machines, specifying the serial port and baud rate.
I'm not sure if you need to specify the local and/or remote address.

Under MiNT this might like like:

pppd /dev/serial2 local-ip-address:remote-ip-address 115200

You will also need to set up routing. (pppd has an option to add default
route via the ppp interface, otherwise use the route command.)

The passive option to pppd is useful if you want pppd to keep waiting for
the remote host even if it was not running at the time when pppd was
started.

Date: 1999-11-20 00:00:00 UTC
From: Christopher Poole <chris@cpoole.demon.co.uk>
Message-ID: <943206173.29996.0.nnrp-03.9e9888df@news.demon.co.uk>
Source record: 70176

Mega STE 4Mb, 170 Mb HD, SM 124 mono monitor

Also 520 ST 2.5 Mb, TOS 2.06

Hand scanner, External floppy drive, Motorola fax modem 28.8, Canon BJ10ex + auto sheet feeder

Software includes:

Timeworks Publisher 2, That's Write 3, Imagecopy 3, Fontkit, NVDI, Ease, MagiC, Kobold, SpeedoGDOS, Calamus 1.09, Diamond Back 3 and more.

Games:

Elite I & II, Midwinter I & II, Flight simulator II, Carrier Command, Populous, Civilisation, Zork I, Planetfall, Hitch hikers guide, and more

Loads of PD/shareware

Lots of mags with cover disks, ST World, ST User, St Format, Atari Computing, ST Review, ST Applications.

Located NE London/Essex area, buyer collects

£150 for a quick sale

Chris Poole

>version...

I can attest that the MagiC version of iPRN works equally as well as the single TOS variant - a demo of which is present on NVDI5's master disk. It's a lot easier to install, just drop it into MagiC's "Extensions" folder. But if anyone prefers to use the auto folder variant that's fine too, and has the advantage that it can be used under all circumstances.

Roger,

I am unable to Re-Partition or even Format the hard drive. The
system will just "freeze" up with the drive light still on.

Steve,

I only have the ICD drivers on the floppy.. nothing else is in
the AUTO folder. I also have no ACC's on it.

I've tried to re-format and partition the drive.. nothing works. It
must be no good. It just will freeze the system and the drive access
light stays on.

As far as the I know the program is available and supports Javascript, but
last time I tried to use it it just did not work properly.

: There are over 300,000,000 web pages out there many of them with the same
: navigation bar throughout thousands of pages. having one external file
: which writes the navbar to each page is a tremendous savings of resources.

Why do you need Javascript to include the external file into the WWW page?
Have you ever heard of server side includes?

It seems to me that Javascript is a ridiculously complicated way to solve
such a simple problem. But maybe I am missing the point.

In the case of forms I do not see how Javascript would enable less data to
be sent back to the server. If the server needs certain data from the
user, that data will have to be sent back to the server, whether in its
raw form as entered by the user or after being processed by Javascript.
What difference does it make except complicate the WWW browser software a
great deal? I suppose the data could be compressed using Javascript and
sent in compressed form. It seems to me this would be of marginal benefit
and at great expense in terms of the client software.

What kind of pirate software will be available?
Ask Uwe if you can post HD Driver there :)
You are going build a web page to benifit all, and you can't even
format a hard disk on your Falcon (of all machines) (sorry, I don't
mean to offend users that do have real problems, and respect the rights
of authors such as Uwe).

Tony,

Please re-read the original post that mentioned Javascript in
this thread.

The point was that CGI scripts (REGARDLESS OF WHICH LANGUAGE IS
USED IN THEM) are a more browser-independant way to do things
than inserting Javascript in HTML sources, because Javascript
implementation on Explorer and Netscape differ; they are still
no browser-independant ways to code Javascript, because each
one interprets things differently.

That's easily answered. Using client-side scripting you can do parts of
the validation on the client, thus possibly saving round trips to the
server (and CPU cycles on the server as well).

Well, I don't have any experience with Netscape's server (assuming that it supports server-side javascript) so I can't comment on that. But I would assume that the environment their used in are much more incompatible that the script-implementations themselves.

>>And? How many MSIE-servers do you see on the net? ;-) Server-side
>>scripting is totally invisible for the client, hence entirely independent
>>of the browser.

> Then see the other thread re: Shareware and CAB OVL not being able to
> do on line credit card transactions.. thats server stuff and thus not
> entirely indipendant.

That has absolutely nothing to do with the server-side scripting, but probably something with CAB not supporting SSL or some part of the http-protocol. Or perhaps the resulting HTML contains stuff that CAB can't handle (e.g. CSS). Server-side scripts returns pure HTML, there's no processing at all on the client. Just take a look at the source for any PHP- or ASP-page out there (e.g. atari.org).

> I use perl/cgi and I believe that is entirely independant

Same thing. Although CGI is a particularly inefficient way of scripting, PHP and ASP is much more powerful and efficient. Btw. did you know that there's two former Atari-users in the PHP-team? :-) One of them (Stig Bakken) is one of the core-members, and the one I bought my TT from.

> PHP is script in the HTML thus requires the browser to support it
> surely?

No, it's processed by the server as it's loaded. The server outputs the result of the script, which should be pure HTML (or perhaps some client-scripts generated by the server-script). This is the same principle as in MS IIS with ASP, and it has many advantages compared to CGI. The biggest advantage is that you have full access to the elements in the document (if you do it correctly! It can be tricky...) so you can reformat the document while processing it.

The point is that you can validate the form before you send it back. So
you don't have to wait for the server to tell you to back up and fill in
the form again :-) If you add validation on the server too, you'll still
be compatible with the (very) few that doesn't have Javascript.

This sounds like it could be solved better with server-side scripting or
CSS.

> Many developers are afraid to do this as well as embrace CSS for fear of
> alienating users, or making the site inaccesible.

The nice thing about CSS, is that it - if done correctly - doesn't
alienate users without CSS-capable browsers.

All GEMScript does is to send messages between applications. I guess you
can create an object-model using AES-messages, but that would be extremely
inefficient.

AUTO C:\DRIVEN.PRG (HS MODEM)
AUTO C:\MFP.PRG (HS MODEM)
AUTO C:\SSC.PRG (HS MODEM)

AUTO C:\STING.PRG
AUTO C:\STING.INF

STING.INF CONTAINS THE LOCATION OF STING FILES.
STING.INF...C:\STING\

Read the establish text.

If you can load the dialer, you should be able to set everything up for
PPP.

If STing fails to load up the STX files then check your STING.INF file for
the location of the STX files.

Hope this helps.

Email me if you have any trouble.

I use
520ST with TOS 1.0 2.5meg of ram.
Through STe,TT and Falcon.
All with STing 1.08, 1.12 Dialer.

None of these do.

However, the STE and MEGA-STe use those 30-pin SIMMs.

The Stacy uses an older very similar kind of module called SIPP,
if I remember.

The plain jane STs must be modified to have more memory, because
the memory is soldered directly on the motherboard.

ST's and MST's have the memory soldered to the motherboard.
There are add on cards for those machines that can utilize the
1mb 30 pin simms.
MSTE's can use up to 4-1mb 30 pin simms.
TT's are different and use a card with memory solderd on, but can use
30 pin simms for fast ram, depending what type of fast ram card is
installed. Falcons use soldered in ram, unless you upgrade to a third
party memory card, then a card that use 30 pin sims, or 72 pin simms
can be used.

Rewritting CAB is not possible I suppose... but what about the new
browser that's been written right now. Couldn't it be possible to ask
the author if he wants to make the necessary adaptations to his browser?

The commercial product you can get on CD sometimes (like TosWin).
Gemulator was sold on floppydisk.
But the free versions you have to download. You can find many
on the 'Revolution CD' from Germany. Whole set of 8? CD's for DM 69 I
saw advertised.

But evaluation takes many more hours!! Problem is telephone costs?.
Does anyone know somewere a CD disk with 'All the Atari Emulators' on
it?

You might need to upgrade to ExtenDOS Gold. With the gold version
I even get longfile name support with MiNT which aslo displays
mixed case.
I don't know if the pro version is updated?

2649. My Mail 0.89

Newsgroup: comp.sys.atari.st
Date: 1999-11-21 00:00:00 UTC
From: peter.slegg@====
Message-ID: <38382357$0$7551@znews.zetnet.co.uk>
Source record: 70199

Hi All,

Recently tried a newer version of MyMail, version 0.89.
I could never get earlier versions to connect to my ISP but
this version worked first time and I didn't have to change
the script.

Unfortunately it has crashed on me a few times and when I open
a mail I get a PID 61 error message (N.AES - Mint) so for now
I will stick with Newsie. MyMail looks nice and has lots
of features. I think Infitra looks better though.

I often surf while downloading mail and I don't really want
MyMail to hang-up on me, is it possible to stop it from hanging-up
once mail has been downloaded ?

Peter.

>.

I downloaded this screen saver for my Milan. It's the only one I have found so far that doesn't seem to have problems.

Just one question, what is the recommended for setting it up under Mint/N.Aes and Thing. I tried following the German docs but my language skills are very poor.

I have XSSINST.PRG in my AUTO folder. Do I need AVBUBBLE.APP in there also ? Is AVBUBBLE just for single-TOS ? I have put the rest of the BUBBLE stuff in the folder C:\BUBBLES

What do I need to put in the configuration file(s) ?

Thanks,

Peter

Agreed with last point. But I have made a quite flexible driver for the
DJ520 for 1st Word PLUS that supports most of the features. I am not
sure whether the original writer didn't have only the PD First Word
version, which has far fewer options.
If he reads this, he can contact me and tell me if he has 1W Plus and
if so, I'll send the driver to him.

this is what I use on Ataris both with Magic and single Tos,CD's that show
up as Mixed case on my PC show up as all upper case on Atari so I wouldn't
say Extendos is at fault all though there were a few patches for it a while
back but can't remember if they were for this problem

Hi,

I am a new Falcon030 user and I have heard different thing about the serial port on my Falcon.
How can I get it above 19.200. I have seen once a program that could acces the port to 115.200 or 56K.
Please let me know. My CPX doesn't allow me to do it, must I do a hardware upgrade ?

Gtx,
Rene

Try changing some of the things in Install.prg, e.g. use Joliet
filenames. (It should be in the manual.)

Hi Peter

I've installed it on my Milan as well but I installed as a autostart
application in Thing instead of in the autofolder, have nothing threre.
As for configs, just start the prg and a window opens and then it's
just to choose.

2661. Running Captive on PaCifiST...

Newsgroup: comp.sys.atari.st
Date: 1999-11-21 00:00:00 UTC
From: Patrick B <bpat123@accessone.com>
Message-ID: <ZH%Z3.2218$RI1.43362@sea-read.news.verio.net>
Source record: 70211

Hi,

I'm wondering if anyone got Captive (Medway Boys version) to work under the emulator. I loved the game, and even though I no longer have my ST, I wish I would be able to play it again on my PC. But when I ruin it, it does the following :

1. Crashes with 3 bombs if I hit '1' right away to start the game.
2. If I hit '2' to get the help file instead, I get it, and then I can hit Alt-'Q' and '1' to start the game, and that works.
3. I get the briefcase open scene (But not the line drops that create the picture)
4. The virtual disk spins (The LED on the keyboard flashes).
5 It hangs...

I stopped PaCifiST, and the code is stuck in an infinite loop that looks like this :

```
BTST #2, $FFFA0B
BEQ.S -10
```

which makes it loop back to the BTST. $FFFA0B is always 0 (I don't have my Atari books, so I'm not sure what system stuff is there)

Anyone successfully ran it and could tell me what I could do ?

thanks,

Patrick

Don't know the specific answer to that, but I suggest you hook
up the HD to your PC and save your files directly. Unless there's
something very odd about the HD, this should work.
Step in, whoever knows better....

Good luck,
Charles.

2663. Where to find Milan in the US?

You just need a newer CPX and/or newer terminal software. Some
communication programs handl the ports by themselfs and the CPX
is not needed. The Falcon can do 115k without hardware mods.

2670. PARCOPY Atari-PC Transfer Programs

Newsgroup: comp.sys.atari.st
Date: 1999-11-22 00:00:00 UTC
From: "John K. Picken" <yg473@victoria.tc.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.991122200444.28391A-100000@vtn1>
Source record: 70096

I'm trying to set up a demo of PARCOPY for my user
group and have had absolutely no luck running Atari-PC or
8-bit PC-PC transfers using a "PARCOPY" cable and an EPP
or ECP port on the PC i.e. no "UNI-BI" adapter. It works
fine PC-PC in 4-bit mode using a "LapLink" cable.

The combinations I've tried include: 1040ST-486 with the 486's
port set to EPP and (separately) ECP. With the same 1040ST,
I've also tried a 386 with a bi-directional (PS/2 type?) port
and a Toshiba 486 lap top with a bi-directional port and got
the same negative results (a message referring to connection
problems).

This afternoon, I tried the program between a TT and a P100
with ECP ports--again zilch with the slight difference that
the server program on the TT quit when the PC tried to access
it. BTW I tried both the 030 and ST versions on the TT.

I've checked and rechecked the 8-bit cable with an ohmeter for
proper connections and shorts--the cable does not appear to be
the source of the problem; it's wired exactly as per the diagram
in the docs except that the shield grounds are also attached. All
tests were run under MSDOS 6.22 on the PC side.

If anyone has any suggestions, I would appreciate an e-mail reply
as I don't normally read the Atari 16/32 bit news groups (diehard
8-bitter :).

Thanks in advance for any help,

John

> the folder C:\BUBBLES

XSSINST must be started in your AUTO folder, if you want to use modules
and if your menu clock should stop it's output. (Of course your clock
must understand the XSSI protocol.)

AV-BUBBLES is just a small server which starts the BUBBLES application
at the right time. It can be used as an autostart application or
accessory and it requests an AV-server like jinnee, Thing, MagiC Desk
and so on. You must not use it, but it's better, because AV-BUBBLES
needs only 30 k memory. Additionally put the BUBBLES.APP in one of your
$PATH folders or define the environment variable $BUBBLESPATH. Then
everything will work fine.

If you don't want to use AV-BUBBLES, you can run the BUBBLES.APP as an
accessory or autostart application.

BUBBLES light is the BUBBLES application without it's userinterface.

> What do I need to put in the configuration file(s) ?

Nothing. :-)

D> costly.. even in the Falcon market!

There is the card from BlowUp, which has Fastram plus CPU speeder plus
graphics enhancements, but I doubt it will be cheaper.

However, there are no new Magnum/F030 boards since quite some time now
(due to a lack of interest - you can't get the required SIMM sockets
in quantities smaller than 50), but maybe you can get a used one or
one that is left in stock somewhere.

directly, but
> they never answered... So, does anyone know? Is it available in the
US at
> all? Or Canada? Will it be in the future, or should I order one from a
> european location?
>
First of all: forget the Milan I! This machine had quite a few hardware manufacturing problems - probably because it was never built in great quantities. There were a lot of machines which worked great and a lot which did not.
I took a look at the Milan II at the fair in Hannover and this machine looks real impressive. At least they are now co-operating with professional hardware manufactureres (Motorola) and distributors (Axro).
To answer your question: the Milan II will be available in the U.S. .
If you consider ordering one from Europe you should try it after the CeBiT fair (yes, the Milan will be there!).
There may be a delay between the release of the German Milan II and the US one but I'm not sure.

Greetings,
Matt.

Some stuff seems to work better on WinSTon than PaCifiST now. There is a nes
version of WinSTon available from "The Little Green Desktop" website (look
them up in Altavista or something - I can't remember the address).

Hope this helps.

Adrian (another lapsed ST owner).

>> "SMTP after POP").
>I understand the words but not the meaning ;-)
>What is this soft usefull for ?

Le protocole SMTP de postage de courrier n'est absolument pas sï¿½curisï¿½,
le seul test que font les serveurs SMTP (et encore pas tous), c'est de
vï¿½rifier que l'adresse IP du client fait partie des adresses IP du
provider possï¿½dant le serveur. Et encore, il est possible de poster sur
le serveur SMTP d'un autre provider que le sien: il suffit que le
destinataire soit hï¿½bergï¿½ chez le provider. Bref, le SMTP, question
sï¿½curitï¿½, c'est nul.

C'est pour cela qu'il y a une mï¿½thode "SMTP after POP", oï¿½ le client
doit d'abord s'authentifier sur le serveur POP3 (qui lui, a un accï¿½s
sï¿½curisï¿½ par mï¿½thodes USER/PASS ou APOP) avant d'effectuer sa
connexion au serveur SMTP. C'est un peu bidouille, mais ï¿½a ï¿½vite
d'avoir ï¿½ carrï¿½ment changer le protocole SMTP.

PS: Thï¿½oriquement un serveur n'acceptant que le SMTP after POP ne
devrait pas accepter un postage par WS. Je suis curieux de savoir
exactement ce qu'il en est, ï¿½tant donnï¿½ que je ne dispose pas de
serveur de ce type pour faire des tests.

PS2: WS 3.30 dispo ï¿½ la fin de la semaine!

That doesn't mean they're not in business to make as much money as possible. That's the point, not that they ARE making money.

>Thats not my point. I'm saying that Hasbro could stretch their considerable
>resource to include programmers converting back to an existing user base
>on genuine Atari hardware...a user base that has surprisingly large numbers.

Large compared to what, the Timex-Sinclair user base?

>PC and PSX of course would be their key business, but they could support the
>genuine Atari hardware in the same way M$ supports Mac OS with some of its
>key software. I'm sure well written games would sell to we Atari users
>quite nicely...I for one would put some pennies in a jar to save for a game
>or two if written...

If it's such a great idea, why aren't all the other companies doing it? Are they all poor businessmen? I think "pennies in a jar" says it all, as that's basically what they'd be getting in return for their investment, relatively speaking.

I realize that Atari is a religion to many (I was part of the congregation for many, many years), but if you look at it with an open mind, I just don't see how you can say it makes business sense for any large company to spend a dime of resources supporting any Atari platform. If you're a very small company looking to create a niche, and you're not trying to make a living off your software, you might have an argument. Though even then, I think you'd have to be part of the religion. Otherwise, I just don't see the motivation.

Ya, if someone in the USA was selling one Lonny, you would have to fight
me for it, I know where you work!! :)

|You wouldnt need both of these, and this is a guaranteed crash on
|most systems.

You might depending on your system. The docs say:

For ST, STE, MegaST: MFP.PRG
for MegaSTE: MFP.PRG, SCC.PRG
for TT: MFP.PRG, SCC.PRG, MFP_TT.PRG
for Falcon: SCC.PRG

(to be loaded after drvin.prg of course.)

I wasn't too sure about GEMScript's abilities and limitations, I've only
had a brief play with the demo (think it's easy and quite fun to use).

Would OLGA be useful for the above problem? -- or am I (again) showing
my lack of knowledge on the subject ;-)

Erm, why don't you wait for the Milan II? It's 060, supported by some
big companies and will be distributed in the U.S. .

Well... the Milan II looks great and will hopefully be more stable than
the old one. But it's a quite fast machine. CAB 2.8 was a big
disapointment with only a few changes and a heavy upgrade price. Adamas
1.7 was faster and looked nicer than the previous version. faceValue
3.0 was introduced so expect a lot of updates for programs written in
GFA Basic.
Last but not least, HomePage Penguin 3.03 was presented. A fresh-up for
users of the version 3.0 and 3.01 will be available in the next few
days from my homepage.

The problem isn't NeST, it's Fortress BBS. AFAIK Kevin had problems with it on transferring back from a PC to an Atari, but he is currently working away from home and unable to fix things - hopefully only for the time being.

> place.

Believe me, this won't work. I work in a university library and can
categorically state from experience that people will *not* read
documentation no matter how good it is. They won't even read the screen in
front of their eyes if they can help it.

So you have two approaches: either the application (I'm using this word
loosely, it includes web front ends to databases etc etc) just attempts to
process duff input, so the punter gets a useless response, or you rig the
form so the buggers *have* to enter something sensible before they get past
data entry stage. My hunch is that there are a significant amount of
submissions containing invalid data, hence the move towards browser-end
validation to avoid tying up the server processing junk.

Not surprising. ASH, being the Microsoft of the Atari market,
always charges nearly the price of new software for upgrades.

So why don't you switch the platform? You'll find then that on other
platforms you pay for an update what you pay on the Atari market for a
NEW piece of software.
BTW, if you think the changes are not worth the upgrade fee, simply
don't buy the upgrade. Nobody is forced to do so.

Big disappointment? It supports now png and it really loads much faster
progressive jpg's. It's more compatible with MiNT. For my it was surely
the money worth. 20,- DM isn't that much I suppose.

>Adamas 1.7 was faster and looked nicer than the previous version.

Was Adamas 1.7 available? Anyway I would not have bought it because the
programmer seems not to believe that Adamas 1.63 is just a trouble maker.
All what they had to say was, he it runs very well overhere. I hate this
kind of behaviour. On my Hades I can't use it for more then a few minutes.
At the Stafford show I've tried to run Adamas offline on a Hades running
MagiC. After 30 sec. the show was already over.

>Last but not least, HomePage Penguin 3.03 was presented. A fresh-up for
>users of the version 3.0 and 3.01 will be available in the next few

I was so disappointed by their reaction I didn't return to the stand of
MUCS, so I missed that too.

They charged 20,-DM for the update. I don't think this is a heavy upgrade price.
However I agree with you when you say that ASH is the Microsoft of the Atari market. I don't like they way they try to force people to use their products.

I don't want to start any "this versus that" thread but I will
answer and this only applies to me, it's my reasoning whether it
be wrong or right.
I do not like the idea of purchasing a machine and then powering
it up the first day, to remove software I don't want or like.
I do not know if the software is optional at this point and I
won't even mention the name. Also money is not an issue for me.
I'm also tired of waiting. I know a few Hades owners and some
run the exact setup I want, hense I know it works before I get it
rather than gamble with some new machine. From what I know of the
Hades it requires less cards cause it has some of the hardware included.
Like I said I maybe wrong on some points, but then I do live in
my own little "Atari" world. ;-)

I never seen a modem that did 230k, Perhaps a lan port. Most 56k modems
I've seen do 115k max? I've seen some odd 2 modem setups, where you have
2 lines involved to go faster.

You need HSModem, which you can download from many ftp sites such as the Belgium site ftp://193.190.204.128 English docs are on my web site, address in sig if you need them.

You copy drvin.prg and scc.prg into your Auto folder in that order. This then activates the Modem 2 port - configure your comms software to use this port and you'll get the speed you want. Be wary of using too high a speed if you're using the higher colour modes.

Go to the STinG support site http://sting.atari.org and download the STinG package, serial.cpx from that is an ideal partner for your serial port and will let you adjust parameters for those comms progs that don't have their own settings.

Hi Martin-Eric,

MER>Not surprising. ASH, being the Microsoft of the Atari market, always
MER>charges nearly the price of new software for upgrades.
although I looking at the facts share your opinion I understand them.
As new customers shall be rare (if there are any) they must live (if
they can) from the existing customers (updaters).

Therefore I don't do all the updates if my soft is working well in the
ancient version. And sometimes I have an update made after one not
made.

My impression of the Hannover show is two: A great Milan and the
atmosphere of "Flohmarkt" ('marche aux puces' in french, please excuse
I dont't know the English word right now!).

In my opinion the fair was not worth to spend more than 300 kms on the
road, sorry.

Und TTschï¿½

No, you may install whatever driver you like over the top of it.
Ideally you could uninstall it first (there's a menu option in
HDDriver for this, not sure about Cecile). You may as well stay
with Cecile if you like it tho'.

Hallo Patrice!

PM>- Zoom to fill the screen

crashes during initialisation (after Keyboard) with exception #2 on my Milan

PM>- BIOS keyboard routines for Atari clones

works in Single-TOS, but is not very playable. Movement goes on as long as the automatic key repeat works, so if you want to change direction while moving forward, you have to release and press again the "cursor up" key.

Under MagiC, PMDoom won't stay the foreground application, so it won't get input from the keyboard.

-devparm indicates 2 to 3, and up to 8 in complex situations.

mit freundlichem Gruï¿½ aus Bubenreuth

Hi Martin,

Javascript comes with built in objects which work in all javascript
browsers. What causes most of the problems is when people write thier
own functions improperly. If you stick with javascript 1.1, 95% of
javascript enabled browsers will interpret the code the same way.

The big problem starts with DHTML and creating fancy javascript
effects. The DOMs are completely incompatable which is easily enough
fixed with a small browser sniffer function that is called when needed.
You have to add two additional lines of code to make the script work in
any browser. The power of javascript is in it's simplicity, but
simplicity sometimes creates lazy programmers who do not take the time
to code properly.

Actually external file support for CSS is horrible, and you need a vrs4 browser for CSS positioning which is one of it's most powerful features. using a server side script would require a call to the server as each new page is loaded which means that on very large sites, you have a lot over bandwith being used to generate the page.

>
> The nice thing about CSS, is that it - if done correctly - doesn't

For formatting text, it is about the best idea I have seen on the web yet, but support for CSS is still sketchy, and if you use any of it's advanced features, your site will not be viewable.

I was reffering to what one of the ASH employees about CAB 2.8 and he
said that PNG support was added and a few bugfixes were done. PNG is
certainly nice but it's not very popular on web sites and I don't think
it will be in the near future.
"Big disappointment" is my personal opinion - I just expected more from
CAB.

On one server for a small site maybe not, but large commercial with tens of millions of monthly visitors, the savings would be tremendous. Internet bandwith is a valuable resource which should not be wasted. If every e-commerce company used javascript shopping carts (which do not have to be secure because nothing is being transferred to the server), the savings would be tremendous.

This is one thing I never understood. Computing is the only technology which squanders resources. A one page unformatted document in MSFT Word is over 10k, that same page on my atari in text format is 1k. The windows help files take up more HD space than all my atari programs combined. I renctly read an article in the computer Q & A in this sundays local paper about someone asking how to free up HD space, the answer was to buy a new HD because they are so cheap, Why not clear the cache and the windows temporary files, which will end up taking up your whole HD if you are not careful. Uninstalling programs still leaves useless files taking up space. On the Atari you just need to find out what programs and files you dont need and drop them in the trash. The point is even though the hardware has improved tremendously, the actually computing experience has slowed down. Advances in technology should allow you to do things faster, not slower. Could you imagine an Atari running the same hardware as my bottom end PC. TOS/GEM running at 400mhz with a 32 bit display 32 megs memory and a 17 gig HD. Even an Amiga running at those specs would be tremendous.

Off topic;

How does the 060 compare to the pentium in regards to true processing power ie Mips and MFlops. Intel seems to think that microprocessors should be rated on how fast they run quake, and use indexes which seem to show a 500mhz pentium to be twice as fast as a 400mhz. pentium. Are

they rated the old way that they did the 486 with the dx2, dx4? Do motorolla chips use this scheme, also if the memory and bus only runs at 100mhz can the machine run any faster.

More off topic stuff, since Microsoft has more or less been found guilty and there will be bunches of lawsuits against them from other companies, where do you think TOS/Gem will stand in this whole realm. Does Digital Research still own GEM

Hi, I am experimenting with Thing 1.27, and color icons, but I am not able to make Thing display mini icons with colors, why ?

I checked the rsc file and the inf file but it should be ok with colors, Thing display the mini icons always with icon and mask color only, that is black and white. I tryed also changing the icon color to red and it works, but color I put in the icon in the rsc file is not shown.

couldn't the entire html file be first read by the js intepreter and then passed onto CAB as a completed HTML file. The end result of any javascript is to write some piece of information to the document. While this would slow down cab, it would at least give some type of javascript support.

We could also barrage Opera software with checks to encourage them to develop for the atari. If there is enough interest they will port opera to the atari, and if they have checks for the program, they will do it quickly. Of course every atari user would have to unite and either prepay, or promise to pay we could have a Opera version fairly qwickly. If we could get Alexander Clause to releaser the source to Opera in return for a share of the profits it may happen quicker. or maybe Santa Clause will have a big surprise in the next release of Cab.

How much pollution would we have if all the cars on the road in the world were not equipped with the smog devices that save 1ppm(1 parts per million) of carbon monoxide.

a 1% saving in bandwith per user with over 100 million users out there would be huge. If each internet user gave you one penny, you would 1 million dollars.

In general, the cycle of business would indicate that the wintel platform is on it's way to the obsolete computer hall of fame just as the 8 bits and the 16 bits did. The 32 bit platform has enjoyed a nice 5 year ride, but it is time for a true 64 or 128 bit system to step in. All the hardware in in place, it will just be a matter of time before the software comes. Software compatability isn't even an issue because Microsoft has demonstrate with the switch from 3.1 to 95/98 that users will buy new software for the new OS and the new hardware. It's the nature of business and now that there is a level playing field, it's anybody chance to be the next microsoft, as microsoft became the next Digital Research.

The same goes for video games. first it was atari, than intellivision, then coleco, then nintendo, then sega, then playstation and now dreamcast. In a few years it will be another company.

I watched someone yesterday try and put a bag of videos into the blockbuster return box although it staes in huge letter only drop one at a time. If there is a way to screw something up, someone will find a way. I watched in amazement as this guy spent ten minutes trying to fix the box because his bag of tapes got stuck. He finally got it fixed and then drove away in a $100,000 mercedes 500sl.

It's not just dumb people who do this either, it's almost everyone. There are even programs which will remember all your personal info so you cant screw up those forms. Even yahoo is offering one click shopping.

Besides wouldn't you feel safer knowing that your personal info doesn't leave your computer until you actually decide to buy.

I agree and back to the original conversation.

What caused AHDI to automatically partition the drive after it was formatted.

Cecile seemed to work nicely, but I was a little bit worried because I cannot read french and had no clue what the menu options were.

Also, is the drive now only useable with the Cecile driver

I would also like to apologize to Uwe for bad mouthing his program. This was wrong for me to do and after several e-mail conversations with Uwe, I think we all should be grateful to still have programmers like Uwe on our platform who has put a lot of hardwork and dedication into HDDriver for relatively limited rewards.

Hi,

I've just been thinking about an old shareware game I had on my ST. It was called "Snowfall" or "Downfall" or somthing like that? It came on a magazine cover disc.

You had to direct falling snow into chutes at the base of the screen. It was single player or split screen two player.

Any help appreciated.

Matt

From: Jon Black <Black@Hotmail.com>
Message-ID: <81gqkr$38l$1@phunn1.sbphrd.com>
Source record: 70065

Hi all

I have a 486SX 40MHz ultra Palmtop with 20meg ram on which I'd like to play ST Games

The only Emulator I can find which will do this at a similar speed to my Mega2 ST is Gemulator for dos,
Does anyone know how to use .ST files with this program without using an external floppy?
Does anyone know of a helpfile which explains how to use this Gemulator for dos

I've looked on the gemulator web page, but its little more than an advert for Gemulator rather than a serious attempt at providing product support

OR

Is there a better alternative
I've tried Pacifist and Winston in Win95 but my machine is to slow

Any help would be great

Thanks

2764. STing Problems

Newsgroup: comp.sys.atari.st
Date: 1999-11-24 00:00:00 UTC
From: atarigalen <kNOkSPAM@uia.net.invalid>
Message-ID: <04e9bbf8.38bf22e2@usw-ex0107-042.remarq.com>
Source record: 70068

Let me tell you all about my tale of woe:

I run a Falcon 030, 14Mb, stock. It took me all of 5 minutes to set up STing 1.15 a few months ago, but for some reason I never could get CAB 2.5 to work with Geneva, so I've been web browsing in single-tasking mode.

About a week ago, I noted a post on CSAST that recommended changing various configurations, like THREADING = 10 and so forth. I tried it, but did not get any noticeable change, positive or negative. It did seem to me, however, that CAB was "waiting for data" more than it used to.

Last night, my wife complained that CAB was not running. I tried it out and discovered that although the dialer seems to work fine, running any application (CAB,MyMAIL,Newsie) slows down the system to the point that it essentially locks up. Timeouts and "Transaction Failed" messages are the norm in CAB, MyMail discovers I have mail, takes 2 minutes to give a "Get Mail" button, and then appears to lock up. I can ping myself with great speed (25ms), but pinging yahoo.com results in 70% lost pings. I tried STing 1.2 and 1.22 last night with no success.

Essentially, I'm now locked off the internet at home and am quite sympathetic with Katherine's frustration with her CT2. Although I have no such accelerator, I have plenty of frustration. Any ideas, anyone?

Like what? The only thing I can think of is the built-in SCSI port
(less than 5MB/s, no DMA, worse than TT). On the other hand, does the
Hades have IDE ports?

2768. Old ST

Newsgroup: comp.sys.atari.st
Date: 1999-11-24 00:00:00 UTC
From: Jon Black <Black@Hotmail.com>
Message-ID: <81h40f$67b$1@phunn1.sbphrd.com>
Source record: 70072

Hi all

I enjoy collecting 'vintage/rare' computers and have recently been offered a Atari 520ST for 30 UKP. Nothing special there I hear you cry. However this ST has no internal floppy, only a single sided external unit and the PSU is also external. it also comes with a newer external atari DS drive and is in all its original boxes.

Am I right in thinking that this is a 'vare find' or would I be better spending the money on x pints of larger and a curry?

Cheers

AFAIK, there is a free version of Gemulator avaliable as a download
from the Emulators Online home page, but the latest version (with Mac
emulation as well, I believe) is commercial.

I wouldn't say that specific model's rare, although they aren't as
common as STFM's!!! If the model you have has no internal disk drives,
no built in modulator AND has a cassette input then I would think it
would be the rare one:)

It's the nature of business >and now that there is a level playing field, it's anybody chance to be the next >microsoft, as microsoft became the next Digital Research.

That's a nice theory, but there's absolutely no evidence that Windows' cycle has run its course. If anything, Windows 2000 and Windows Millennium promises to increase, rather than decrease MS' stranglehold as the OS standard. The only thing out there even resembling competition is Linux, and it has a long way to go before it even catches up with Mac OS, let alone Windows.

>The same goes for video games. first it was atari, than intellivision, then coleco, >then nintendo, then sega, then playstation and now dreamcast. In a few years it >will be another company.

Um, Dreamcast IS Sega. And though it may be the most attractive system out there, I'm guessing that Nintendo and Playstation still kill it in sales. Just because a new system comes out doesn't make it the new standard. And NONE of these systems had the stranglehold now enjoyed by Windows.

One of the configuration options on the Windows version of Gemulator is
to map an .ST file to drive A or B. There may be something similar on
the DOS version.

In any event, could you not change your .ST file to regular files on
your desktop and transfer them to the palmtop that way?

>How do they force anybody to use their products?

By making some programs Magic only. For instance can I use Chatter, teli
and ASH mailer with N_AES? No, I just can't. Oh sure I can use Iconnect
with N_AES but the clients just needs Magic and that's what I really hate.
An Atari program should run on every Atari OS available and not just on
one particular OS be it N_AES, Geneva or Magic.

Sure PNG is still not very popular.
The thing that makes the upgrade the money worth is that Cab loads really
much faster progressive JPG's then before.
As test I loaded a page containing 13 midsized progressive jpg's:

Cab 2.70e: 3'17"
Cab 2.8: 0'44"
Wensuite 3.20c: 0'19" (Waw)
Draconis 1.63: Couldn't run the test as Adamas crashed after a few secs.
Probably due these prog. jpg's

>I don't have a Hades so I can't say anything about Adamas running on
>the Hades. But Adamas runs quite well on a lot of Ataris.

Can you tell me then why so many people are complaining about the
instability? Believe me it isn't just an invention of me but pure reality.
According to a Dutch who read a German forum there are many people
complaining. I've had a little discussion about Adamas in a Dutch
mailinglist. The most of the readers do have troubles with Adamas.

>Adamas 1.7 will be available in December.

Oke, I'll give then a new change.

Why don't you 'go' for it? The only problem with buying overseas is the question of voltage - in other words you want a different power supply from that supplied in Europe. I can't imagine that is a major problem. I am not suggesting you throw your money away but why not order a Hades from System Solutions (if they sell overseas and, of course, they might not) and change the power supply to a US standard?

I bought my Hades board from Canada - paid by credit card without any difficulty. The Customs took some money off me via the shipper.

I really don't like Doom much, but I just had too see how it would look like on my Falcon/Afterburner/Nova. I'm impressed! :-) It looks really good, and plays just like on a fast 486. I miss some music though, have you thought about adding a midiplayer?

It's not perfect though, I would prefer if it locked the AES when running. It would also be nice if it could switch to 320x240 on the Nova (or any other graphics-card for that matter) by itself, and switch back when exiting. I'm going to try and write a shell/wrapper that does this on Saturday.

Prototype with Alpine P060 board (communication and
debugging circuit which plugs into the secondary 68060
CPU socket for data download from CENTurbo II equipped
Falcon, via two ribbon cables; there is also one IDE
socket on this Alpine board, for a Zip drive).

>Did you see Dolmen ?

Dolmen was already shown at the April 1999 Neuss exhibition.
It was running on a CENTurbo II Falcon, which also had the
PCI section of Phenix contained on a small daughter card,
driving a 4Mbyte PCI graphics card (S3 Virge DX).

>Was the motherboard functionning ?

Yes, but the OS boot code was not complete (it will be in
a few more weeks) so the only thing on screen was a nice
black and yellow chess-board pattern.

All Ataris should be collected and treated kindly, but you might
be better with the curry (lager is bad for the liver). The early STs
were as you describe and there are plenty of them. I could sell you
another if you wanted (no external floppy).

That's interesting. I sometimes have a nice curry for
lunch when I'm at the office. One day, while at my
favourite local curry house, I gave my order and
noticed the person behind the counter was adding up
the total on a large 32-step memory Atari calculator!!

So, what type of curries do Atari users like?

An Atari is not just for Christmas, it's also good
for working out your curry budget.

I don't get too many chances to read c.s.a.st anymore, but I've seen these posts about doom and decided to give it a try. I'm having some serious trouble, though. I apologize in advance if this has all been covered before...

My machine is an almost-stock TT, TOS 3.06, 4 meg ST ram, 8 megs TT ram, 420 meg HD with lots of room. No Magic, MiNT, NVDI or other extensions, just plain old TOS. Atari PTC1426 color monitor.

The initializations seem to go fine and the title screen appears. Every few seconds the top 1/3 of the screen disappears, line-by-line, then returns. Hitting ESC brings up the main menu, after a long delay. Using the arrow keys to make a selection takes a -long- time. When I hit the arrow, the little skull cursor doesn't move for at least 5 seconds. When the game finally begins, I can't move - or maybe it's just so slow I can't tell that I'm moving. When I exit the program, the top third of the display is garbled, but I can see bombs. Usually two but sometimes four. I've played around with just about every video and keyboard parameter, but the problem is always the same. I've tried turning off all the AUTO programs and CPXs, but that doesn't help.

Is there something I'm overlooking, or is my TT just too underpowered?

If anybody can help, please also let me know by email because I don't have much time for newsgroups.

Thanks!

> suggestions?

If you have STraTOS CD 4 from Atari Computing Magazine there is a version
of shareware Doom1 in the CD04\BEBOX\ directory. This is just a ZIP file
and has in it 'DOOM1.WAD' shareware Doom episode WAD file.

Failing that it should be on most ftp sites for PC, and hopefully in a ZIP
file...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi Bram

I could mail it to you, but keep in mind it's almost 2MB packed.
I just followed the link from Patrice homepage and downloaded it,
it's called shareware_doom_iwad.zip if I remember correctly.

Because only one file needs to be accessed from the server for the whole sie, and stays in the clients cache. Also many ISP's don't allow SSI's

> It seems to me that Javascript is a ridiculously complicated way to solve
> such a simple problem. But maybe I am missing the point.

Anytime you can process data on the client, you save bandwith, and speed the site up. Have you ever tried an animation with a server push.?

> In the case of forms I do not see how Javascript would enable less data to
> be sent back to the server. If the server needs certain data from the

> and at great expense in terms of the client software.

I guess you could call it pre-processing. Excluding secure data, lets say you have a client who wishes to purchase 10 items @ $5 each and he wants to see the difference in price with 2 day shipping versus ground shipping. Most people will not take the time to figure this out, so the total has to be processed before the final okay to buy. Javascript allows you to change these values without any server accesses. While a simple comparisan isn't all that much, why not create your shopping carts in javascript and then send the total as an encrypted result to the server. Each time you add, modify, delete in a shopping cart, you are accessing the server which slows down the site and consumes bandwith.

javascript is a completely misunderstood language and since it's a scripting language, many don't consider it a programming language, but it is a ver powerful language given the limitations of the web. It is also a lot more compatable than most people think. Bad programming makes for the bunch of problems with javascript.

I am curious as to how much processor time a javascript interpreter would take up on an Atari computer. If the speed would be too slow to make up for the savings in download and server access.

Mikey,

Why must you resort to insults. Do you think you will hurt my feelings. You even forgot the whole initial conversation was about getting my Falcon back up and running. The only thing people may get offended at is your trashy mouth. If I recall correctly, this original thread was about Cecile and if it was a trustworthy driver, and yes, I was aggravated and called HDDRiver "CRIPPLEWARE" (sorry UWE, you do have a fine product and your support and professionalism is exceptional)

You Mikey, on the otherhand attacked me and started using profanity. I called you "ignorant" which means "lack of knowing." If you are so ignorant as to be insulted by this word, then you truly are an ignorant person and I would strongly suggest you go to http://www.amazon.com and save 25% on your next purchase of Websters dictionary.

I am tired of the Ash Bashing. There is no one left, they are still around, so they must be doing something right no matter how you may feel. Stop complaining, no one forces anything on anyone in the computer industry. If you don't like the price of an upgrade, just don't bother with it. Not everything can be free. If its not worth it, sit this upgrade out.

No matter what you may think, ST Atari users are better with ASH than without ASH, even if you don't use their products.

I just wish updating was as simple as going to an Atari show and giving the disks in exchange. Something a little more difficult here in Canada. Last time I was able to do this was at the TAF 92 SHOW.

I upgraded STALKER, WARP 9, CALAMUS, and a handful of others.
Now updating, or even registering a product in your name is difficult.

As for the forcing of products, their is a bit of tied selling involved when a piece of software will not work in TOS/MINT/GENEVA but only Magic, or is advertised as such.

Later Brian.

I've heard of programs such as MonSTer, although I've never tried
them myself.

Depending on your soldering ability, and if you have an STFM then
Lacescan is a hardware resolution enhancer that works well.

If you want to look at that then go to http://sting.atari.org

Check that you do have a connection by running the get_ip utility
from the PPP "tools" folder. Use (say) zetnet's news server as the
target for your enquiry.

You could also try Olivier Booklage's overlay which works well
with an IConnect connection.

Hi there, I am getting rid of my Atari 1040STe computer. It does NOT include the monitors nor does it include any printers or even modems. It is just the unit itself. It has 4mb RAM, TOS 2.06, power cable and a trackball in which I used as a mouse. It does NOT include any software.

I am asking $50.00 + shipping to ANYWHERE in the US, but must be in the form of a MONEY ORDER, as that I will NOT take personal checks.

Please send me e-mail as that I don't get in here often and my server doesn't store the messages after one day.

--
Doctor Vell is a FICTIONAL person with an e-mail address, go figure that one out? He even has his own Doctor Who web page, it is located at: http://www.fortunecity.com/lavendar/poitier/353/index.html

You really should visit http://www.ettnet.se/~dlanor/ to get the latest versions.

I've been using STinG with Geneva+Neodesk for a long time with very few problems. Geneva seems to stay too long in supervisor mode somewhere resulting in lost packets on MIDI ports. This happens both on TT, MSTe and ST. Also serial speeds above 57600 does not work. I use CAB 2.5 Aftp, Newswatch+Popwatch, BNET, Ftpserv, Weblight etc without problems on 4 Ataris and a pc in a serial network. The CAB overlay by Olivier Booklage does _not_ work btw. but the Ackerman does. Maybe that was your problem?

>can ping myself with great speed (25ms), but pinging yahoo.com results
>in 70% lost pings. I tried STing 1.2 and 1.22 last night with no
>success.

Note that Newsie sometimes can make mysterious changes to any files on your harddisk without telling you. This can happen if the logging is active. Perhaps there is something wrong with the Hsmodem programs?

I'd suggest you do a fresh install of all autofolder programs and STinG files on C:\ .

Set the recieve buffer in SCC.PRG with the "Setter" to 4 KB and send buffer to 2 KB. Keep everything else like in the distribution.

I use this autofolder order with Geneva on my TT:

JARXX.PRG
NEOLOAD.PRG
MACCEL3.PRG
NVDI.PRG
DRIVIN.PRG
MFP.PRG (not needed on the Falcon)
SCC.PRG
MFP_TT.PRG (not needed on the Falcon)
MIDI.PRG
GENEVA.PRG (runs as late as possible to avoid lost packets)
STING.PRG

Note that some autofolder programs can disturb STinG. On my Mega 4 with 19" Moniterm monitor I had to change to another monitor driver to avoid lost packets. Also on the Falcon be careful with high screen resolutions.

> Hades have IDE ports?

Yes, the Hades have EIDE. What Lonny means is that you don't need any cards at all, except from a graphics card, to get it up running, and be very compatible with the TT. This is because the Hades have nearly all the Atari specific chips, like MFP, YM soundchip and so on. DMA sound is missing, together with DMA SCSII support. Altho the SCSII implementation in the Hades doesn't support DMA, its still much faster than using a TT. I do agree that the Hades is way to overpriced, tho, but as of yet it is the only machine with a 060.

We'll have to see about the anti-trust settlement matter. M$ will not die
as a consequence of any settlement action, but vendors will be allowed to
dictate the terms a lot more from here on in...who knows? Maybe I'll be
able to buy a Linux based x86 machine off the shelf?! ;)

> >The same goes for video games. first it was atari, than intellivision, then coleco,
> >then nintendo, then sega, then playstation and now dreamcast. In a few years it
> >will be another company.

More like in a few months when PSX2 begins selling in numbers. I've seen
Dreamcast in action, and have watched PSX2 preview clips on TV. The PSX2
looks to be the system to beat. Dreamcast doesn't really do much more in
my eye than good N64 or good PSX software already does, but the PSX2 clips
I've watched are well and truly stunning. GFX on the PSX2 offerings to date
look as good as pre-rendered video from a few years back that might take
days to create and yet the PSX2 creates this on the fly...

> NONE of
> these systems had the stranglehold now enjoyed by Windows.

Windows' stranglehold is weakening. Evidence of that is a sudden
plethora of
companies opening Linux network/web/server applications. WinNT stuff is very
scarce all of a sudden, and the Linux companies are offering price/$$ solutions
that make $$ comparable NT systems look sad...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

2811. help with 520ST please

Newsgroup: comp.sys.atari.st
Date: 1999-11-25 00:00:00 UTC
From: tim.h@sk.sympatico.ca
Message-ID: <383e9989.40602490@news.sk.sympatico.ca>
Source record: 70006

A friend of mine gave me an Atari 520ST, it works great, only there are no manuals with it. My last Atari was an old 130XE, and much has changed since then. If anyone knows where I can get manuals for the 520ST (online versions are ok too) please let me know.

Also, is there a way I can download atari files from my PC, and then transfer them to the Atari?

any help is appreciated

tim.h@sk.sympatico.ca

|Let me tell you all about my tale of woe:
|
|I run a Falcon 030, 14Mb, stock. It took me all of 5 minutes to set up
|STing 1.15 a few months ago, but for some reason I never could get CAB
|2.5 to work with Geneva, so I've been web browsing in single-tasking
|mode.
|
|About a week ago, I noted a post on CSAST that recommended changing
|various configurations, like THREADING = 10 and so forth. I tried it,
|but did not get any noticeable change, positive or negative. It did
|seem to me, however, that CAB was "waiting for data" more than it used
|to.
|

I am using the latest updates to Sting on my TT with Geneva/Neodesk. CAB 2.7, Newsie, Aftp, and Popwatch are working great in multi-tasking mode. I use MTU=576, MSS=536, Threading=10, and DEF_RTT=500. The latest updates to Sting have really increased the speed of internet access. MTU set at 1500 and MSS set at 1460 slowed down the speed on my provider.

yes, Atari made calculators. In fact, I picked one up myself at one of
the London Atari shows from Goodmans. Neat romboid patterns on it. I also
remember seeing a foldable flat calculator with the readout on one half
and the buttons on another.

>
> So, what type of curries do Atari users like?

I'm afraid I'm not too up on curry, though I did try making an instant
one with raisins at the hostel on that same trip.

Tell you what - if I show up in London next year like I plan to, you
can have me tag along to the curry houses and we can try all the different
ones. Or if you come to Toronto, maybe we could pick an Indian restaurant
at random and try them out :)

Hi,

> Hello,
>
> I've have Mandrake Linux installed on my PC and would love to
> install it on my Atari TT030. I know it is available (Debian)
> but I was
> wondering how it compares to the i386 version.

I have recently installed Debian Linux on my Hades and after playing
with it for a couple of weeks I really like it.

Debian GNU/Linux running on my Hades looks quite similar to Linux
(Red Hat 5.2) running on several PC's at work. Most of the
packages that come with the installation CD's are the same for
the i386 as for the M68K and Debian comes with a lot of
packages spanning two CD's.

The only areas that I would say are different for the M68K version
is when you come to applications such as StarOffice, and Netscape
(unless you use Mozilla) which are not currently available for
the M68K. The usuall packages such as X Windows, SQL, C/C++, Perl,
BASIC, Pascal, Java, Tcl/Tk, Apache, FTP, IRC and Gnome are all there.

If you like Linux and are prepared to put up with the slightly
more long winded installation process than the PC equivilent
then it is well worth installing Linux on your TT.

> Any Atari Linux web pages? Besides what's on the linux-m68k page.

I don't know of any, but there is quite a long list of Atari Linux
users available from the Linux M68K WEB Site who are quite happy
to help out.

Hi All

Further to my last add I have now added prices.

TT030, 4mb ST RAM, 4mb TT RAM, 100mb internal SCSI HDD, 1.44mb FDD,TOS 3.06, replacement mouse etc. Atari PTC1426 VGA monitor styled for TT Case (looks the business). Software installed includes MagiX 6.01, NVDI 5, Papyrus and lots more. £225.00 for both OVNO

10X external SCSI CDROM drive £45.00 OVNO

External 270mb SCSI HDD £50.00 OVNO

Link DMA cable with software £25.00 OVNO

Tabby Graphics Tablet (Quill supplied) £15.00 OVNO

Please contact me @ paul_matthews@yahoo.com if you require further information.

Many thanks

Paul

You know, I would even load MagiC on my Afterburner if programmers would dive into the graphics market a little more. I have Photoline, Apex, Dyna Cadd, Cyber Cadd and a ton of others. It would be real nice to have a simple "drag and drop" TTP that could make an MPEG out of an FL* or AVI, or at least implement some of the newer compression schemes that are currently used to get better compression of video. It gets pretty boring working with 1 minute animations/video whose file size if over 30 megs!
Photoline is cool, but misses some features that other high end graphic applications utilize (and I am NOT talking about Photoslop). A few attempts at rendering applications like NEON, but jezz, I never figured out how to use it. To vague. Chronos-Amlink-Phoenix is still the best of all, maybe not quality, but for production, it is great.

Networking? Who needs it :) I like pretty pictures!

My 2cents,

Mikey

The ST uses IBM formatted disks (720kb from memory) so you should be
able to put your IBM disk into your atari and copy the files.

It would be a start! External .js files could automatically be passed to the js interpreter as well as the html file and the final output sent to cab as a completed html file. This would slow cab down tremendously, but using the dsp might help

Hi Terry,

Sometimes i tend to babble a bit on the keyboard. Anyway TOS/Gem is an OS perfectly suited for smaller computing devices. The new dreamcast has internet support and I always wonder why CAB was never slapped into a jag cartridge since AFAIK the jaguar does have networking capabilities. Replacing the 68000 in the jag with an 060 or even a PPC and using Gem/tos/cab as the interface, hasbro has everything they need to create an intreractive games/internet machine based on TOS which they probably could sell for $99 bucks.

Well there is Microsofts heavy promotion of CE, and there is also the fact that when 95 and 98 were launched, Microsoft was seen as the saviour who made computers easy, while this is not true, the public doesn't know the whole truth. Unless win2000 is a major upgrade to 95/98 the press wont be as welcome to new Microsoft products as they were in the past. Microsoft has taken a bad black eye from the whole monopoly thing and the environment is ripe for another company to step in. Gates stole the whole DOS scene working out of a hotel room. The internet has also made it easier for software companies to get a product out. You are right there is still no viable alternative, but TOS/Gem is still available, and Amigados/intuition is owned by Gateway.

> Um, Dreamcast IS Sega. And though it may be the most attractive system out
> there, I'm guessing that Nintendo and Playstation still kill it in sales. Just

Haven't you seen the sudden drop in Playstation and Nintendo system prices when Dreamcast was launched. Sega had 300,000 in prepaid orders before the product was launched. You are right, not since Atatri first release the 2600 has anyone had a monopoly in the VG arena although nintendo had a pretty tight rein for a while.

The one thing about technology is that you will never know what will take off.

Happy thanksgiving

The hardware manufactures now have choices and many of the contracts they had were illegal. Linux or even Tos emulators can now be offered by the hardware manufacturers with their fear of having the windows license, or other microsoft products revoked. It is estimated that Gates owes $40 to everyone who purchased a computer with win 95 or win 98 add all that up plus lawsuits by almost every other software company, microsoft has a lot of problems. The wait for the trial to be completed would hurt microsoft more than if they just settled and went their ways, because then all the 'baby bill' could go back to playing hardball in their respective domains. Now microsoft cannot make a move without being scrutinized and if the other harware manufacturers dont start offering alternatives, the final verdict will be way harsh and could even put microsoft under.

Basically what this means is that over the next two years, if a viable alternative does not develop, penalties will be a lot more severe than if one does develop quickly. This would indicate that there was only a problem with distribution. If it comes that no viable alternative develops, then the indication would be that microsoft not only created barries in distribution, but that they created barries in the software and to access in the basic running of the machine. I personally dont know the answer and this is only speculation on my part.

I was walking though the local Compusa section and the PC area gets smaller day by day. Mac products are squeezing in from the right, general peripherals from the left and back and Linux from the front. There are at least 12 linux products, several books and several magazines. The games section has less choices than any good Atari store had atari games back in the old days. The same goes for the application section.

I have the docs and libs for this, but the problem is that the lib is
PureC only :-/ If you want this stuff just send me a mail and I'll mail it
to you.

Certainly it would be "possible"... unfortunately it is highly
unlikely to ever happen.

Right now there's an emulator which simulates running an IBM PC AT, on
P/PCs but it's relatively slow, only emulates an 80286.

That ought to be sufficient to emulate a standard 68000 in an ST I
would imagine, but the problem would be convincing someone to actually
do it.

Try writing to Dared Mimicked at www.emulators.com (he wrote the
GENerator emulators) and see if you can get him interested.

(Tell him BOBR wants one too... :)

I'm curious about this because the keyboard that came with my used TT was pretty badly damaged and took a lot of work to get into a useable condition. If I could replace it for $40.00 I would, but in the US those new keyboards are around $120.00. Wouldn't you just be able to swap the keycaps around on a German keyboard? (I admit severe ingnorance on this subject, but I thought the keyboard just put out "position" codes that were interpreted by the computer as specific keys depending on what layout the computer was set for internally.)

Anyway, thanks for the information Dennis. Would I do better to write Seidel in German or would English be acceptable?

I'm not sure where MS' promotion of CE is relevant. Please explain.

>and 98 were launched, Microsoft was seen as the saviour who made computers easy, while
>this is not true, the public doesn't know the whole truth. Unless win2000 is a major

But I think Windows has gotten better over the years at making computers easy.
While it could be a lot better and a lot less bloated, I don't think it's that
hard to use. And it's not like there's something out there easier to use,
currently.

>upgrade to 95/98 the press wont be as welcome to new Microsoft products as they were in
>the past. Microsoft has taken a bad black eye from the whole monopoly thing and the
>environment is ripe for another company to step in. Gates stole the whole DOS scene

I agree that the environment is ripe for competition. I just disagree that this
equates to evidence that the Windows cycle is nearing an end.

>working out of a hotel room. The internet has also made it easier for software companies
>to get a product out. You are right there is still no viable alternative, but TOS/Gem is
>still available, and Amigados/intuition is owned by Gateway.

So? I was just at Best Buy and didn't see any TOS/Gem or Amigados/intuition
applications on the shelves. Same with all the Sunday circulars. I also don't
see where these offer any great advantages over Windows. They may be easier to
use, but that's because they do far less.

>Haven't you seen the sudden drop in Playstation and Nintendo system prices when Dreamcast
>was launched. Sega had 300,000 in prepaid orders before the product was launched.

I'm not surprised. Dreamcast is a major player. Good competition leads to more
quality products and lower prices. That doesn't mean that it's all of a sudden
a monopoly, though, nor that it killed any current monopoly.

>The one thing about technology is that you will never know what will take off.

True.

P.S. Please stop sending your replies to my email. Thanks.

Other than market demand, what's stopping stores from selling them now? And as long as 95% of the software on the shelves is Win-based (with the other 5% Mac-based), where is the demand going to come from? I'm sure it will probably happen eventually, but not in any great numbers, especially with Win2000 and WinMillennium eminent.

I haven't seen PSX2 in action, but have seen the NBA and NFL games on Dreamcast and was absolutely blown away by the realistic graphics and animation. There's no way N64 or PSX could do what I saw. I don't doubt that PSX2 will at least be comparable, though.

That still just barely scratches the Windows surface, however, and doesn't even address the stranglehold enjoyed by Windows 9x. And Windows 2000, the successor to WinNT (NOT Win9x), will likely kill a little of Linux' momentum (if you can call it that). Most reports of Win2000 so far have been very positive, and it will come with a ton of publicity, most of it free.

And just who is the market for these machines? Computers far more powerful,
much faster, and much more compatible with all the software out there, are being
almost given away these days. And far more powerful game machines with a ton of
software already available can be had at a comparable price.

Who but Atari zealots would want such a machine?

FaST or FaSTer?

The bilingual english/french magazine on a disk from Canada popular in 885/86, or the ones we produce? Details of the latter are on our website, the Canadian disks will be harder to track down; we used to have copies but I doubt if I could unearth them, ISTR there were only four or five issues.

I had to drive around 1600 km (return) and I really hadn't any regret I
did that. For me it was the best fair ever. Small but very nice indeed. I
met lots of people. I had a great talk with Ulf Dunkel, Axel Gehringer,
Ulli Ramps, Konstantin Woller and the guys of Run software. Due lack of
time -I had to return at 14:00- I missed some other guys.

> kms on the road, sorry.

This is the case of most recent Atari shows, even German ones.
A couple of freeware miracles and, sometimes, a new hardware,
but otherwise mostly old STs nobody wants and, if you're lucky,
a second-hand TT accompanied with a lot of goodies selling for
almost nothing, being dumped by its owner.

In my hand I have here a thin calculator, on the back is a label
telling:
Solar&battery operated.
Use G-10 button cell
Designed and engineered in USA by Atari corporation
Assembled in China

On front is the Atari logo with ATARI next to it and under it
8 digit dual power
There is an lcd display and some solar cells on the top half of the
calculator. That top half can be rotated upwards for better viewing.

I was given this calculator as a biznuss present from Atari Benelux
in the long dead past.

IIRC this was one of the first ST models, before the STM, STF and the
rest. They weren't around for long as people objected to the external
power supply being much lke the 130XE.

If I'm right it would be fairly rare but only because of it's age and
short production time.

What does that have to do with Windows? That sounds like a hardware problem to me.

FWIW, my PC has never had to be serviced, though it's only a couple months old. I've added a new HD, a new LAN card, a new CD-RW and a ton of software, with very few problems. And adding the new hardware couldn't have been much easier. Not only was the actual hardware installation a snap, but Win98 automatically sees the new hardware and loads the appropriate driver. Nothing like buying a new piece of hardware and having it up and running in less than 30 minutes, with nary a single problem.

I agree that exclusive contracts are bad for competition, but that happens in other industries as well. Even assuming the antitrust trial stops that practice, MS has such a head start on the 'competition,' you're still going to see 99% Windows-based PCs, because in general, that's what people want. They want to pick up a software title off the shelf and have it work on their machine. That means having Windows installed as their OS.

>F*cked up drivelous bullshit!! For every M$ app there is an equivalent, if not
>an exact copy, that GETS THE NEEDED JOB DONE, on most other platforms! In

Would love to see an equivalent to IE5 or Netscape on the Atari, but alas, nothing comes close. And nothing ever will, because the resources and necessary hardware just isn't there (at least not in substantial numbers). And since Internet software is arguably the most important application for any computer these days, it makes the Atari obsolete for many.

>addition there are fantastic Atari/Amiga/Mac based apps that will never see
>light of day on a Windows box. Best Buy are probably being f*cked up the arse
>by M$...

No, Best Buy is in business to make money. The vast majority of computer users use Windows, ergo, the way to make money is to sell Windows compatible software. They do sell some Mac software, your "f*cked up the arse by M$" comment notwithstanding, since there is also a pretty good sized Mac user base. Not sure why they'd sell Atari and Amiga software, though.

> a monopoly, though, nor that it killed any current monopoly.

It is a major player, but many people were stung to some degree with the Saturn,
which here was a relative flop. Those people are likely to be PSX
converts, as
the PSX is still #1 currently. They are more likely to goto PSX2...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

The official manual is pretty useless, IMHO. The only thing you have to
learn is the use of the GUI - clicking and double-clicking, dragging
etc.

>Also, is there a way I can download atari files from my PC, and then
>transfer them to the Atari?

Yes, format some double-density (NOT high density) disks *on the PC* to
720 kB and the Atari can read them. With later Ataris the PC will also
read Atari-formatted disks, but only with TOS 1.4 onwards.

According to Ronald Andersson, the Sting cpx's override some items in
default.cfg and the cpx (except for Internals) is'nt needed as long as the
default file is there (that's where my set-up is at now running fine on a
stock Falcon MKI 14meg). E-mail me at swampfax@earthlink.net for the cfg
file if you like. Also, I don't think the Falcon MFP.PRG is needed unless
a hardware draw-out of Modem 1 was made.

I've used 28,800, 33k, and now a U.S. Robitics 56k modem. I get a 45k connection with the 56k modem on my TT and is quite a bit faster than the 28,800 modem. Most of the time it's really fast although there are times that the internet is slow.

My brother lives across town and uses a 400 mhz Compaq. He gets up to 52k connections but no lower than 49k.

I am aware of these facts and yes I know the benefits of PNG over GIF.
If you would have read my comment carefully you would have notice that
I speak about the current situation and the near future.
All that I'm saying is that it is
a) currently not popular on web sites
b) PNG support is buggy even in 4th generation browsers
c) most web designers still advice to use the GIF/JPEG combination

Maybe PNG will succeed one day but who knows? There were also a lot of
great other graphic formats such as some formats using fractal image
compression.

Hi John,
I've adjusted my Sting default.cfg to settings suggested by
Ronald Andersson and don't use Stingport or Sting Protocols (only Sting
Internals) and feel there's an improvement (though not tested).

Hi Joe,
Is that 45k a connection rate or an actual download rate? I like
the SupraFaxModem (28.8 uped to 33.6) because the display can show the
actual connection rate which varies with the phone line conditions.
31k (receive and transmit) is about the best my phone company provides me.
That translates to about a 6k download as CAB shows.
John

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

(Update: 11/18/99) I've just added more 8 Bit Software to my Catalog. Programming Languages & DOS's from OSS, HOFACKER, Alpha and even Atari MicroSoft BASIC & Atari LOGO. Lots of Utilities & Copiers like Chipmunk and Impersonator. My Catalog is growing by leaps & bounds.

(Update: 11/04/99) I've just added a bunch of Titles to my Atari 8 Bit SoftWare Catalogs. All Games!!! A number of them are UnOpened! Many for only $5 a pop! And I went through my Catalog and did some adjusting of prices. Right now my 8 Bit SoftWare Catalog has a bigger Byte count than ever.

Atarians Unite! Are you pining for the days of a simpler Computer? Do you miss Arcade Classics like Asteroids, BattleZone, Joust, Missile Command, Robotron 2084 and my favourite Star Raiders! Well Bravo Sierra Computers has them. Are you wandering, wandering in the desert of violent video games. Games too violent for children? With Blood & gore? Two companions of youth nowadays. Especially those you hear about in the news who kill fellow students at school. If your preferences for games lean more towards family friendly. Like it used to be. Try some of my Atari Arcade classics. I have oodles of Atari SoftWare! As well as truckloads of Atari HardWare. And Libraries of Atari Books. Reference material and things you thought you'd never find! So come check it out. The best of Classic Atari 8 Bit & Atari ST. E-Mail me at

e-mail: atari@benjamin.net

Or call me anytime at (503)256-9974 to talk to a warm, friendly, people person! Your more likely to reach me from 3 PM-3 AM Pacific Standard time. And thats most likely the times I can return calls. I'm perfectly willing to call you, on my own dime to answer your questions. I'm a people person and those who have dealt with me will find me patient, a good listener and even a good teacher. So if you can't call me Today? Call me Tonight!

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact check it regularly as my Catalogs are updated regularly. I have 6 different Catalogs, and my SoftWare Catalogs are my

largest. They have the biggest Byte Count. And remember if you can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, December 9th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get together with other Atarians. Make friends, meet new people, maybe find an old friend. Eat Pizza, drink Pop or Beer in a decorative atmosphere. Bring your family to a family friendly place. For more info try:

Integration of video game players and the internet is here. I believe that the dreamcast uses
a variety of linux for their internet access. Small handheld devices are also becoming extremely popular. Most of these users do not care what the OS is thye care about if it works. You forget that although the jag is an old machine, it is still a current generation games machine, and atari had a new enhanced version under development to compete against the
n64 when that became available. Hasbro has all the technolgy at its fingertip to quickly place a new machine on the market, and with their clout at the toy stores anything they put on
the market will sell. Web Tv is selling pretty good and it only uses a 120 mhz processor which is peanuts compare to the ppc even inemulation mode. The biggest thorn in the side of fully integrating video games and the web is the actual storage capacity of a full OS and graphical browser which would requirw some form of mass storage. TOS/GEM/CAB would take up less than 1 meg in a flash rom and makes manufacturing such a device feasable. The market is
the gap between web tv and the video game consoles.

Microsoft has publically stated that the biggest threat to their windows business is the small
handheld devices. With the popularity of these PDA's comes peoples desire for a similiar interface on their computer. Many people are buying the PDA's even though they don't own a computer, these are the future purchasers of new computers and whater OS is running these PDA's will be the OS of choice for their computer purchase.

I think Windows has too many technical flaws to develop beyond where it is today. What will win2000 be, another bunch of bug fixes and adding in more popular utlities. The windows registry system is seriously flawed, and memory management is pathetic. Even after you close
program you run out of memory, and the only way to reclaim this memory is by rebooting. i am
not talking about a few hundred k, I am talking about megabytes. I do a lot of work on the pc
and don't turn it off at night, but after two days of opening and closing programs, I run out
of memory. Microsofts solution is to get more memory. You can never fully uninstall a program, and windows still writes files to all over the place.

I strongly disagree that Tos/gem does far less than Windows, if anything TOS 4 offers a lot more features than windows that are very important like full drag and drop. Being easier to use is the most important feature itself. Speed is another important feature.

The whole point is that there are several 32 bit OS's out there that could be had for cheap which do eveything your average computer user needs or would ever want to do.

It will be interesting to see who become the next "king of the hill"

BTW sorry about the e-mail, i guess I should stop that all around anyway because my address book seem to want to keep all the addresses that I send out even though I tell it not to and
has caused a few problems when I send e-mail to friends and family an dbusiness associates becaause i add some of the wrong people who are so quick to be offended.

Best Wishes

B.P.

Many newer win machines integrate the modem and the sound card for the voice mail feature. My modem crapped out the first few days of installing new programs. I jjust removed it and installed an external. Windows tries to manage the hardware which is the job of the bios, part of my theory on windows restricting the bios manufacturers to avoid support of anything that might be considered an alternative OS.

But what about the event handler of JavaScript? Or how do you change
two frames at once with this method? (just two examples) I don't think
parsing the Javascript part before displaying the HTML page will help
very much. This technique is used for scripting languages like PHP or
Perl but they were built for this purpose.
It may work for some pages but at last the browser has to support
JavaScript (like Adamas).

Any of the retailers will sell what people will buy, this is probably the only area which msft doesn't and cannot control. They stopped selling atari computers for two reasons, atari never really made the hardware available to the mass retailers and when they did, atari never delivered on time. I actually brought my jaquar at Toys r us and there was a very large section for jag products, but atari could not keep the space filled with product so the shelf went to someone who could. Apple is finally learning that they have to make the hardware available to retailers and that specialty apple stores don't work (even though my speculation is that apple will buy compusa). retailers care about three things, advertising, delivering a product and paying the warehouse manager a bribe for a slot. Basically what this means if you are going to heavily advertise a product and have enough of that product to meet demand, and you pay the warehouse manager enough to ensure that the warehous has enough of your product in stock the retailers dont care who or what you are. Walmart sells $120 billion dollars worth of crap a year and could care less about msft and their $18 billion in sales. Walmart did more in sales last year than Microsoft has done since inception. In the world of big business, msft is a bit player and an almost insignicant part of this counteries GDP. Even Apple is approachin $9 billion in sales which is down from around $14 billion a few years back. Apple made a serious decision by switching to the PPC and alienated their user base, but the long term effects may have been worth it.

Ben, if I was you I would remove this passage from the advert. It
reads like you want to profit from those murders, not really the sort
of promotion you want.

I know what you mean but it comes across badly.

There certainly was a deskjet driver for Atari WP although probably
not a 520 as that came out after WP stopped supporting Atari. Have
you tried the older driver? You should be able to modify it using
the printer.prg that came with WP if it doesn't do everything
correctly. (I should have that driver somewhere as WP was my main
word processor for some time and I did use it with a deskjet 500.)

This is to let you know that David Zicarelli (formally of Intelligent Music) has given me permission to have the Atari version of "M" available at my site for FREE. This is very cool, because M is a one of a kind midi program that very Atari musician should have! So ENJOY!

I also have pages for Cubase, Dr T's Omega II, Music mouse and other stuff. Tying to keep the Atari Midi stuff alive.

here is my site:

http://atlantis-bbs.com/dconrard/index.htm

Would appreciate any comments as well.(besides that I look like "my favorite martian" on the opening picture!..I am working on that one!)

Tim Conrardy

From: Matt Jaap <mjaap@atari-computer.de>
Date: Wed, 24 Nov 1999 09:58:50 GMT

Hi Matt,

>I don't have a Hades so I can't say anything about Adamas running on
>the Hades.
Is this some kind of joke? German humour perhaps?

From the three available browsers Draconis holds three titles:
- it's the most expensive of the bunch
- it's the worst of the bunch
- it's the slowest of the bunch
and it's contending for a fourth title: the worst commercial program of the year. It crashes at random, forgets his settings, ignores all the Atari standards and has a *useless* javascript module, has anyone actually managed to access a JScript powered website without getting error messages?

Draconis should *NOT* be on sale, it's still in beta stadium. And when considering that development of this program is now well over two years, and that there still is no progress I think the word CRAP is in place here.
It doesn't work online and offline... in my book this means useless, since a stable online connection is not possible, the clients included with Draconis are worthless as well, if these are of the same quality as the browser.... oh boy :-))))
BTW: Draconis Pro can't even handle newsgroups.... where do they get the nerves to call this Professional ?

>> All what they had to say was, he it runs very well overhere. I hate
>>this kind of behaviour.
>
>What else could they say?
If a user of this piece of crap reports problems, they should LISTEN and pay ATTENTION for a start, if ten users report similar problems they should do something about it... Instead they act like the user is an ignorant piece of sh**. We've paid good money for this crap... they have a moral and perhaps a legal obligation to the user (customer).

Once again it's happening.... apart from ASH, R.O.M and Invers who treat their customers with respect we're being swindled once again!!
Over the years I was forced to do business with similar cowboys like these guys, I'm still here.... they are gone...
It's distributors like MUCS that give the Atari platform a bad name and make people run to other platforms. The days that a softwarehouse could

afford to release some useless crap and charge money for it, are long gone... thanks to Internet and the newsgroups, we the users can now inform and warn each other.... this is a new situation, and the dealers better take this in consideration....
Gone are the days that we've had to rely on an article in a magazine to know if something was any good...

>But Adamas runs quite well on a lot of Ataris.
MUCS Atari's I suppose?

>Adamas 1.7 will be available in December.
Will it be free? I have no intention of paying these clowns one single penny anymore. If so, can I download the upgrade? with what? not with Adamas that's for sure!!

Cheers from Belgium

I Think this IS an STM. It was the first ST I bought (I still have it -
heavily modified). With hefty "brick" external PSU and ad-lib (mine was a
NEC) floppy.

To make it clear, it wasn't me who was complaining about the
update price. I always buy the updates. I bought me the Cab,
Resource Master and Kobold update.
I only said that I don't like the way they are doing business.
Sure they are doing something good but remember ASH is not a
software house. Without ASH the authors of the different programs
will still be there.

>
>No matter what you may think, ST Atari users are better with ASH than
>without ASH, even if you don't use their products.

The only benifit customer wise is that it's easier to get an
update or new programs. However ASH itself does not make programs
at all. So if ASH decides to leave the Atari market these products
will still be available as long as the author support our
platform.
Furthermore I do use some programs, like Phoenix, Kobold,
Papillon, NVDI, Cab and Resource Master.

There is some fundamental mathematics done on both fractal and the
newest baby in the block: wavelet.
Results are promising for both but it will take a few years. Only
then I assume there will come a need for a picture compression format
that is scaleable and not glued to some pixel-form.

The event handlers are something I left out and probably the most important part, but wouldn't they be parsed through when the interpreter handled the html. Of course the interpreter would have to wait until the whole page loaded to sort through everything and therefore make the interpreter pretty useles for anything much other than a novelty.

As usual you see things I haven't said at all. What I ment is that I
don't like it that they make some products MagiC only whilst there isn't
any reason at all to that so. That's what I call forcing people to buy
their products (a Micro$oft trick).

Actually Dreamcast is running WinCE (AIUI), so it's part of the Windows
stranglehold.

The big mail order vendors (eg Dell) are starting to offer preinstalled
Linux as an alternative to Windows, at least in the UK.

According to teh new PCW magazine, an interesting development has just
occurred which may make Linux much more interesting to buyers of new PCs: M$
has just announced it will stop supplying Windows installation disks for
shipping with new PCs. Vendors will either have to provide a "knobbled"
version on CD key coded to the machine's BIOS or just supply it on a
partition on the hard drive (absolutely useless if the HD goes band and you
need to reinstall). They tried to introduce this in early November but due
to protests have put it back to January. Now if anything is guaranteed to
put people off it's the prospect of not being able to rebuild your system if
it gets corrupted. A PC manufacturer can, however, supply a Linux
distribution complete with a bunch of apps and all the CDs and keep the
price low as well.

Fingers crossed, folks... :-)

Will the PSX2 have a built-in browser etc, though? The Dreamcast can apparently be used as a web appliance straight out of the box, largely as it runs WinCE. Plug it in and sign up and Bob's your internet access (though you'll need a keyboard too). Personally I am not particularly interested in either machine (so have no axe to grind), but it strikes me that Sony need to make sure thay can offer a similar idiot-proof internet facility otherwise the Dreamcast may be more attractive to a lot of people who so far have found net access too expensive/daunting.

Nope: WinCE, which has all the necessary bits in ROM (cut down IE etc).
Apparently (going from same magazine article as mentioned in other post)
the idea is to use Hotmail for email, presumably to avoid the need for local
storage. The thing comes set up for a free ISP (ie just pay for the phone
calls) and you just plug it in and go.

> The biggest thorn in the side of
> fully integrating video games and the web is the actual storage capacity
of a full OS and
> graphical browser which would requirw some form of mass storage.

Which is why the dreamcast is using WinCE: it fits in a ROM and doesn't need
mass storage.

People may not want this specific machine, but there is definitely a market
for "internet appliances", boxes simple enough to use just like TVs and
phones. You unpack them, plug them in and there you go. The Dreamcast is
such a beast, a Jaguar with suitable software in ROM would have been
similar.

Many people don't want the hassle involved with setting up any kind of
computer and a simple box giving them web browsing and email is all they
want/need.

Except that those in the know are advising businesses to avoid Win2000 on release and wait for at least the first service pack before adopting it, to see if any more Y2K bugs appear for a start and generally to wait till all the unfinished bits are tidied up... ie people are learning from the Win95 and Win98 experience.

Meanwhile Linux is slowly but surely eating its way into the server market
:-)

Hi Terence,

>Wouldn't you just be able to swap the keycaps around on a German
>keyboard? (I admit severe ingnorance on this subject, but I thought
>the keyboard just put out "position" codes that were interpreted by
>the computer as specific keys depending on what layout the computer
>was set for internally.)
Not really, some of the keycaps contain German specific characters,
the keycodes are maintained in TOS, and the German TOS version is
different to the English/American.
For the same reason the MagiC OS needs a small file that remaps the
keyboard, the original key layout corresponds to the German version.

>Anyway, thanks for the information Dennis. Would I do better to
>write Seidel in German or would English be acceptable?
No problem... all German dealers understand English perfectly when it
comes to selling goods. It's only in case you need to complain that
they only understand German ;-)

Cheers from Belgium
Dennis

To be more precise I meant the timer event. But there are of course
many other examples. What about window.open or location.href?
Also most javascript links won't work.
JavaScript really needs to be built into the web browser or at least be
used as an overlay (like Adamas does) with full access to all page
elements and the browser routines.

Greetings,
Matt.

Ben,

Thanks for replying..

I really have no clue whats included in the M68k Distibution..
so forgive the Q's..

Does it come with a graphical browser? You mentioned Gnome.. does
KDE work on it? I'm still new to Linux, but what I've seen of the i386
version I like.. alot! To me, and a buddy... our pc's seem to be
faster in linux than windoze.

Any tips on installing it? I'm downloading the Debian CD image file as
I type, I'll burn the cd to make the install a little easier. But the
second cd image file on the site contains Sources.. what's included on
the 2nd Debian cd?

Thanks Again!
Rob

| Hi Joe,
| Is that 45k a connection rate or an actual download rate? I like
|the SupraFaxModem (28.8 uped to 33.6) because the display can show the
|actual connection rate which varies with the phone line conditions.
|31k (receive and transmit) is about the best my phone company provides me.
|That translates to about a 6k download as CAB shows.
| John
|
|rate

John,

The receive rate varies quite a bit and I'm not sure how accurate it is. I have gotten receive rates up to 18000 and 8000 to 9000 is not uncommon. Most of the time it shows about 4500. I had gotten up to 7000 using the 33k modem. The 56k modem is quite a bit faster than the 33k in the long run though.

Most of the time I connect at 37k, 38, or 40k using Sting. I always abort the connection if I connect under 36k. Using the ATI6 command, the modem shows the fastest (45k) and current connect rate (most of the time at 45k).

|
|
|John Logan
|.

John,

A while back there was an article in the news media (AP?) about using MTU at 576 instead of 1500 in the U.S. It was supposedly faster and was recommended for Netscape and Internet Explorer.

When I used Stik, I had MTU set at 1500 and it worked well. Sting does not work too well for me set at 1500, but 576 does. I use DEF-RTT at 500 since 1500 seems to slow down Popwatch downloads. I have also tried other settings including 850 and 300. I always seem to be changing the settings in Sting to try and get better speed.

>Regards, /Peter/

Make certain your ST is equipped with a DoubleSided Drive. If you have an SF354 external drive, then it is single sided. If you have an SF314 it is double sided. If it is an internal drive at the side of the computer it can be single sided (rare but they existed as I had one of these too).

To check, highlight the A:/ floppy disk icon and move the mouse to the file menu and highlight the format option.

Try to select Double sided 720K. Single Sided is the Default.

Hope this helps.

2912. 80 column posts

Newsgroup: comp.sys.atari.st
Date: 1999-11-27 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <I2S%3.663$x67.585@198.235.216.4>
Source record: 69910

I remember when I first started reading this newsgroup during my second incarnation as an atari user some 2 years ago, there was a discussion that appeared, generally as a result of the Ash internet program which seemed to fail to put carriage returns at around 80 columns.

This resulted in alot of frustration if you had a straight reader like NEWsie which doesn't reformat the text. An editor does this. The debate and evidence clearly supported that 80 columns was to be the format used.

I don't believe I have seen any more posts from the Ash Emailer that are like this as I don't pay to much attention to the headers:-). However I used to just delete posts that were ridiculously beyond 80 columns. Of course I could change my font to fill the screen with the full text, but I am not bothering. If the post was really good, as some have been lately I may reply, just to view the text in the editor.

However it seems to be that people are using 90 columns and more, more often as they reply using there wonderful MS products.

I enjoy this about as much as I enjoy receiving HTML mail.

I get two copies of a 3 word message in text and html.

My friends have heard my curses enough to know better and turn the HTML off.

But really the gist of the post is that .....

1) Microsoft is the devil:-).
2) The users of MS products don't have a clue what their programs are doing.

Well, I hope people read this with a bit of a sense of humour and hopefully I will be reading the replies in 80 columns.

P.S. am I wrong now, some 18months after the last debate, to be fixated on this 80 column debate?

Later Brian.

This is really too bad that there is no easy solution. I need full CSS2
and javascript support.

Sounds to me like you should be bitching at the author of your software for not adding pretty basic functionality.

The world's not going to slow down just because you still want to use decade old hardware. I love my Ataris, and I know I _can_ get them on the 'net, but it's a lot easier and a much richer experience to access the 'net in other ways.

Jeff

2917. Cheap ST Games for Sale

Newsgroup: comp.sys.atari.st

Atari Games for Sale !!!!!!!

E-mail : oscar@agra.globalnet.co.uk

Work in all ST/STFM/STE Machines.

NOTE : All prices (noted with the symbol #) are in UK pounds
NOTE : All games are original, NOT copies !

** OFFER : Buy #10 pounds worth of gear and get any single game FREE

List of Productivity Software/Hardware : (#7 each + shipping in pound sterling)
---
* STOS Maestro Plus (Hardware Sampling cartridge and software included)

List of Compilations :(#4 each game + shipping in pounds sterling)

** (ALL BOXED + MANUALS + ORIGINAL DISKS) **
* Giants
(includes Outrun, Gaunlet II, 1943 and Street Fighter)
* Quatro Sports
(includes BMX, Italia 90, Advanced Ski and Pro Tennis)

List of Games : (#3 each game + shipping in pound sterling)

(ALL BOXED + MANUALS + DISKS)

* Baal
* Batman
* Deja Vu
* Driller
* F-19 Stealth Fighter
* Falcon (Game + Mission Disk Vol 1)
* Galdregons Domain
* Ghouls 'n' Ghosts
* Gods
* Gold Rush
* Heimdall (1 Meg)
* Hook (1 Meg recommended)
* King's Quest II
* King's Quest III
* Quadralien
* Leader Board (Game + Tournament Disk Vol 1)
* Lotus Esprit Turbo Challenge 2
* Magic Pockets
* Midnight Resistance

* Midwinter
* Navy Seals
* Night Breed
* Operation Wolf
* Premier Manager 2
* Rick Dangerous
* Robinson's Request (1 Meg)
* Shadow of the Beast
* Sly Spy - Secret Agent
* Space Quest II
* Space Quest III
* Spy vs Spy (Artic Antics)
* The Quest for the Time Bird
* Transartica
* Uninvited
* Zool

List of Games : (#2 each game + shipping in pounds sterling)

(NOT BOXED ONLY ORIGINAL DISKS + MANUALS)

* Another World
* King's Quest IV
* Leisure Suit Larry II
* Leisure Suit Larry III
* Operation Stealth
* Police Quest II
* Secret of the Monkey Island
* Storm Master
* Street Fighter II
* The Godfather III (Action Game)

List of Games : (#1 each game + shipping in pounds sterling)

(NOT BOXED, (1)NO MANUALS, (2)ONLY ORIGINAL DISKS)
(1)Manuals are not really needed to play these games anyway
(2)Original Disks, we do not sell pirated software,so don't even ask.

* Alien Syndrome
* Crystals of Arborea
* Hard Drivin'
* Indiana Jones and the Last Crusade (Action Game)
* Oil Mania
* Panza Kick Boxing
* Rock 'n' Roll
* Silk Worm (Boxed but no manual)
* Spitting Image
* Strider
* Trinity
* Trivial Pursuit
* Wrestlemania

Newsgroup: comp.sys.atari.st
Date: 1999-11-27 00:00:00 UTC
From: Schoengarth <dons@qnet.com>
Message-ID: <38401A98.DF119E14@qnet.com>
Source record: 69917

I have put a set of Baseless joysticks(tilt joysticks) up for auction on ebay. These joysticks work off some type of mercury switch. I really cant tell you how they work but they work great. They are in great condition. Looks like they had little use. I did try them out on Miner 2049er on a 130xe it was a little weird playing with a joystick like this but, it was also alot of fun. Microshaft thought they had something new with their tilt joypads . There is no reserve for this auction. Happy bidding

Starts: 11/21/99, 22:00:34 PST
Ends: 11/28/99, 22:00:34 PST
Price: Currently $4.75
To bid on the item, go to:

>and Win98 experience.

And that's good advice. But I know a lot of people who are already using it and
say it's much more stable than Win98, and is compatible with virtually all of
their software, even though it's really a new version of WinNT, not Win9x. A
lot of Win9x users will upgrade, partly from confusion over the name (thinking
it's a successor to Win9x), and partly because it's just better than Win9x
(again, from what I've heard).

I have Win2000 RC2 on CD-ROM (picked it up at Comdex), and will probably be
installing it later today as an alternative OS. Then I'll be able to better
draw my own conclusions. I'm hoping I'll like it enough to make it my primary
OS. I'll get around to testing Linux one of these days, too.

Agreed, word-wraping is indeed fairly basic to implement.

HOWEVER, it doesn't justify M$ breaking standards set by
industry-wide RFC specifications about textline widths.

> The world's not going to slow down just because you still
> want to use decade old hardware.

Excuse me? NEWSie and other Atari TCP/IP software is 3 years
old, at most, at least when it comes to STiK/STiNG stuff. Also,
MiNT-Net exists only since 1994.

> I love my Ataris, and I know I _can_ get them on the 'net,
> but it's a lot easier and a much richer experience to access
> the 'net in other ways.

Richer?

Like what, getting a 12KB email containing 3 words, repeated
three times as plain-text, html, and RTF, just so that idiots
using M$ products can read it over a strawberry background?

Agreed. I said it way back when this debate started and I'll say it now.
Regardless of whether or not 80 columns is proper Usenetiquette, every reader
past the initial alpha stage should have word wrap built-in. It's a very basic
feature of any type of reader.

And Microsoft may be the devil, but there are an enormous number of people using
their software, many of them ignorant of netiquette. And just because they
aren't computer gurus doesn't mean they don't have something worthwhile to say
(most newsgroups have nothing at all to do with computers). Seems silly to
ignore them just because their messages aren't preformatted.

2926. FREE to a good home...

Newsgroup: comp.sys.atari.st
Date: 1999-11-27 00:00:00 UTC
From: kurilla@lvcm.com
Message-ID: <38403861.9725239@news.lvcablemodem.com>
Source record: 69924

The time has come for me to admit that I have no further use for all of my Atari STuff. I haven't used it in years, and it's just been collecting dust (and taking up space) for all that time. I really don't want it to end up in a land fill somewhere as long as there's someone who wants to use it.

Anyone who is willing to pick this stuff up IN PERSON at my home in LAS VEGAS, NEVADA is welcome to it. It's probably best for me to give it all to one person to insure that all of the power supplies, etc., go with the correct pieces of hardware.

The computers are actually in their original shipping containers! The last time I used each piece of hardware it was working. If it no longer works, at least you got it for free!

IF MORE THAN ONE PERSON WANTS THIS STUFF, THE ONE WHO CAN GET HERE FIRST WILL TAKE PRECEDENCE. I'll monitor e-mail for the next few days, and notify the "winner".

If you are interested, AND CAN PICK IT UP IN PERSON, e-mail me at kurilla@lvcm.com, and let me know when you can pick it up. Here's the list:

520ST
MEGA ST 2
SC1224 Monitor (Color)
SM124 Monitor (Mono)
ROCTEC RF302R 3.5" external floppy
SH204 Atari Hard Drive
The STilt (handy ST desktop organizer)
A floppy duplicator gizmo (the software is in my STuff somewhere)

Original Atari Developer's Kit! (all 2000+ pages, in binders!)

Many games including DUNGEON MASTER and CHAOS STRIKES BACK
Many aids/cheats/editors for DUNGEON MASTER
(I think) Every START magazine with disk!
GFA Basic
GFA Compiler
GFA Companion
Prospero Pascal
Prospero Developer's Toolkit
Personal Pascal

TDI Modula 2
Jefferson Modula 2
Book: "A Programmer's Guide to GEM"
various 68000 books
Other STuff I didn't want to catalog

Thanks,
- Thomas

Joe,

So are you saying a higher speed modem will get you a faster download rate even though the latter may only be around 5k-20k? And does the Robotics modem have a display or do you have another way to see your connection rate? The latest Supra just has idiot lights!
John

You can make these yourself. All you need is 2 DB19 connectors, 30cm of
shielded cable, and a soldering iron. It is a simple pin to pin connection,
but the cable has to be short.

Because the correct URL is:
http://oxo.systems.online.fr

I'm posting this using the latest WS 3.30a, and it is a lot more
stable than previous versions. Very fast, nice features, but still
a few things to finish (bookmarks, FTP...).

Hiya Atari fans !

The 18th issue of Toxic Mag has been released some
days ago. The site : http://toxicmag.atari.org

It's a French webzine but some articles were roughly
translated into English... :)

You can send me your advices, suggestions, criticisms,
comments, etc.

Bye all and have fun :)

PS: ZIP archive of the magazine very soon !

| Joe,
| So are you saying a higher speed modem will get you a faster download
|rate even though the latter may only be around 5k-20k? And does the Robotics
|modem have a display or do you have another way to see your connection rate?
|The latest Supra just has idiot lights!
| John
|

Yes. The U.S. Robitics 56k modem is faster regardless of what speed CAB
displays.

After I disconnect from Sting, I load my terminal program Stalker. I can
then enter the command ATI6 to display the connect rate info.

80 max but 72-76 prefered to make space for qoute signs and scrollbar
when using 640 screen width.

>
>Sounds to me like you should be bitching at the author of your software for not
>adding pretty basic functionality.

Okami happens to be one of the programs that do not wrap. Kind of
strange as it has lots of other useful functions including ones that no
Microsoft newsreader is capable of. My guess is that Jos den Bekker has
done this out of "political" reasons: because of the 80 col max RFC,
there is no need for word wrap in any newsreader :-)

>
>The world's not going to slow down just because you still want to use decade
>old hardware. I love my Ataris, and I know I _can_ get them on the 'net, but
>it's a lot easier and a much richer experience to access the 'net in other
>ways.

OK it is possible to use 1:st Word as editor with Okami but the Okami
version I am using now is dated sep 13 -99 _and_ I am three versions
behind the latest beta!

Actually posts with too long lines are more common in this group
compared to others (non Atari related) that I follow.

I do have Outlook Express 4 on the pc here next to the TT I'm using
now, but for most mail&news usage Okami actually works better. The only
(for me) important feature that the Atari setup lacks is the
possibility to only download the "subject lines" for a group. In groups
with lot of traffic where only a few posts really interests me (like
rec.autos.tech) it takes to long for my taste to download all headers.

Possibly verging on probably in some cases. Unless the particular M$ product
is just misbehaving.

> Well, I hope people read this with a bit of a sense of humour and
> hopefully I will be reading the replies in 80 columns.

Well, as I'm using Outlook Express for news, I'm hoping I'm not guilty. I
have it set for using plain text only (no HTML) and wrapping at 76 columns.
If it's not doing this then please let me know and I'll investigate further.
Interestingly I think this is the default setting for recent versions of OE,
as I don't remember changing it, just checking it.

> P.S. am I wrong now, some 18months after the last debate, to be
> fixated on this 80 column debate?

Nope. It's a standard and means everyone can read the messages comfortably.
As such it's worth adhering to it.

Hi!

DV>>I don't have a Hades so I can't say anything about Adamas running on
DV>>the Hades.
DV>Is this some kind of joke? German humour perhaps?

Yes, it's some sort of running gag. Probably just for insiders but we think
it's quite funny.

DV>From the three available browsers Draconis holds three titles:
DV>- it's the most expensive of the bunch
DV>- it's the worst of the bunch
DV>- it's the slowest of the bunch
DV>and it's contending for a fourth title: the worst commercial program
DV>of the year. It crashes at random, forgets his settings, ignores all the
DV>Atari standards and has a *useless* javascript module, has anyone
DV>actually managed to access a JScript powered website without getting
DV>error messages?
DV>
DV>Draconis should *NOT* be on sale, it's still in beta stadium. And when
DV>considering that development of this program is now well over two
DV>years, and that there still is no progress I think the word CRAP is in
DV>place here.
DV>It doesn't work online and offline... in my book this means useless,
DV>since a stable online connection is not possible, the clients included
DV>with Draconis are worthless as well, if these are of the same quality
DV>as the browser.... oh boy :-))))

Wow! I haven't seen that much program bashing without one bit of constructive
criticism for months. Just had to quote the whole text again as it is quite
impressive really...

DV>BTW: Draconis Pro can't even handle newsgroups.... where do they get
DV>the nerves to call this Professional ?

I don't have a Hades so I can't say anything about Adamas running on
the Hades.

You can register Thing directly with the authour as I did.
Long filenames work fine here with MiNT and Thing 1.27, but then
I'm not using magicmac so I cannot say if 1.27 will sovle your
problems.

It's not in great shape.. I don't know if it works. There are several pins that are missing on the connector that connects to the ST, so you'll need to figure out a way to fix it.

That's why it's free.. not that it's worth a whole bunch anyway..

First one to email me with their address gets it.

You need the original floppy to use the modules, so that won't work. I sold my copy of the extra modules (Score Trax, Cue Trax, and Studio Module) with my copy of Cubase Audio Falcon several months ago, so I can't help.. I don't know if Steinberg still sells them, but you might try calling them. The extra modules cost $150 (for all three).

The Score module if I remember correctly is not part of the pakage of 3
modules (Studio, cue Traxs, Style). Its just an additional module like the
IPS, which can be loaded or not depending on memory requirements.

At one time there was Cubase and Cubase Score, CAF came with the Score module.
I think I have it around, if I do can you take it as an email attachment.

To use the others you need a original key disk.

Regards,

Rich

Net etiquette is a very simple concept that a number of people can't grasp. Without which the Ng's aren't even worth reading due to the lack of structure. I made a post on another group I am a part of just last week. It was in reference to the fact that many people have their M$ auto-quote feature turned on and don't bother to edit the quote before sending. This messages that eventually included the whole thread as a quote. Now this 80 character complaint has surfaced here and it is no different. There is a total lack of respect to the readers of the postings that has resulted in these "infractions". Some people have never been taught the etiquette so we will have to bear with the odd case of poor etiquette. But I must say in reference to John Jewl that the problem exists with the person refusing to adhere to the standard and not the person who doesn't upgrade his newsreader in order to deal with the morons in the world . Boy the ME generation sure is getting good at yelling "It's not my fault".

Interactive is closed since May 1999
TransAction "only" translates softwares
We have created such a registration service in France, dubbed "France
Shareware Distribution", but we only register french users (the euro
currency is really usefull...)

I suppose you can see on the Cyberstrider website for a Thing registration
they do a great job

The thing I dislike about ASH is that many of their products offers less
functionality under anything not MagiC, and still costs more than if
you're using MagiC ("power user")... Here in Norway that would be illegal,
I don't know about Germany but it's IMHO definitely unethical.

Hi everybody!

Sorry for being late but the ZIP archive containing the Toxic
Mag #18 is available since some hours. Now, it will be more
economic for you :)

The site was entirely remade, you can :
- participate to the debates by filling in a form
(some problems with WenSuite I think);
- download almost ALL the issues (Atari AND HTML versions);
- have some info about the magazine (history, how to
participate, and so on)

Here comes the URL :
http://www.chez.com/toxicmag/
or http://toxicmag.atari.org

Have a good reading :)

Message-ID: <Pine.BSI.3.96r.991128173149.13762D-100000@shell1.interlog.com>
Source record: 69810

Hi again.

First of all, thanks to everyone for all the help.

But, I'm still trying to get a functioning PPP link.

I have STinG dialing, submitting the username and password. Getting the dynamic IP address and then it times out while "Initialising link..."

Here is the text coming back from the ISP when I dial in with a terminal program:

ts3.tor S19 login:<username submitted>
Password:<password submmitted>
ts99>Your address is 206.108.93.84
PPP session from (198.53.145.203) to 206.108.93.84 beginning....~}#@!}!}!}}4}"~

I tried making it search and skip the "...beginning...." text before data stream, but still no luck initialising the link. Is the whole last line needed to for initialising?

I also tried SLIP with STinG, and like with the STiK SLIP, it connected but the client apps do nothing. Just the occassional flicker of the SD/RD model LEDs.

Ken

2964. Atari MegaSTe 4 for Sale

Newsgroup: comp.sys.atari.st
Date: 1999-11-28 00:00:00 UTC
From: Don Schmidt <dschmidt@pacifier.com>
Message-ID: <3841cc29.0@news.pacifier.com>
Source record: 69812

The time has come for a new owner for the Bear Cavern BBS's equipment.

The following Atari equipment and software are for sale for $500 plus handling and shipping.

Optional: Will include an APC BackUPs 400 UPS for an additional $40 plus handling and shipping.

1 Atari Mega 4 STe equipt with 50 MB hard drive, Ajax chip, 1.44 floppy drive. With a JinMouse (better than an Atari Mouse).

1 Atari 14" swivel base monochrome monitors.

1 Atari SC1224 color monitor.

1 1.1 Gigabit Seagate SCSI Toad Tower Hard Drive with Adaptic card.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
This hard drive is the one used with the BBS and contains several hundred Atari, MSDOS and Windows files.

1 540 MB Quantum hard drive with an ICD II adapter.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
Built in the same box, a 750 kb floppy drive. The floppy is good but the cord length makes it unreliable. Best to remove it and use it as intended.

The BBS software is BB/ST by Quantum Microsystems. Old but reliable.
The program has been improved by Anthony Watson (Mountain Software), improving the file library and the File attached Mail.

Maintenance software on the BBS includes, Diamond Edge, Diamond Back, ICD Pro Utilities, SCSIWAIT 3.

Two external SupraFAXmodems, 1 v32.bis and the other 33.6 (these are the ones with the display)

Dozens, if not hundreds of 750 kb disks with commercial software, Magazine files, and STReports downloads and manuals. (Also the Best Electronics catalog).

Cords, powered monitor switch (will switch from one monitor to another including the AC)

Mega STe Field Manual

Lots of software

I don't understand this logic. No one is suggesting that NEWSie start creating messages with infinite line lengths. People just want it to word wrap, so it can read messages with all line lengths, standard or not. It hurts no one but NEWSie users by stubbornly refusing to implement word wrap.

Where? Sure, PNG is slowly emerging, and I'm pleased to see it's the default format of Macromedia's Fireworks (and other programs), but I certainly don't see a proliferation of it on the web (although this will happen in time).

> > b) PNG support is buggy even in 4th generation browsers
>
> Incomplete, yes. Buggy, not.

There's probably little chance of bugs because so many of the browser implemenations are incomplete, not taking advantage of what PNG has to offer. It's safe to say that PNG browser support is both incomplete and buggy.

> > c) most web designers still advice to use the GIF/JPEG combination
>
> Sorry, that's not true. Nowadays it's PNG/JPEG.

Of the 300,000,000 web pages, how many would use in-line PNGs? Maybe the really "progressive" sites would, meaning those also using CSS and JavaScript. Even then, I've visited such sites and it's a little disheartening to see a 4.x browser display an empty box in place of a PNG.

> fixated on this 80 column debate?

MacSOUP's default composition line length is 72, which I would think is safer than the 76 of Outlook Express and other newsreaders.

MacSOUP has a handy function to rewrap quoted text -- a salvation for many of the wonky followups that appear, most of which are generated by Outlook Express (because of the sheer number of users). It's not that Outlook is a bad newsreader, it's just that MacSOUP forces the user to adhere to standards. For instance, with followups you can't normally post an article over 80 columns: a warning appears to "rewrap" the text before it's queued or sent. The logic here is that bad practices shouldn't be propagated, whereby the software must have the means to compensate for the configurations of other newsreaders.

How arrogant of you to assume everyone is a moron who doesn't conform to your
standard. Being ignorant of netiquette and being a moron are two completely
different things. In case you haven't heard, the Internet is growing by leaps
and bounds. That means many, many new people are coming on board daily. Your
high horse notwithstanding, not all of these people are morons. And many likely
have something very worthwhile to say, regardless of what newsreader they use
and how they have it configured. The Internet and the influx of OE users
(again, many of whom are very intelligent) is not going to stop because you and
your little elitist group want it to.

Hi Dennis,

DV>From the three available browsers Draconis holds three titles: - it's
DV>the most expensive of the bunch - it's the worst of the bunch - it's
DV>the slowest of the bunch
that's your opinion. I think you're not right, for
- ok, with the price you're right, but compare to PC software...
- no, I think it's in the range
- and it's (a little bit) faster than CAB.

I have been using CAB with ICONNECT since 2 years and after all, I'm
satisfied.

I downloaded the Draconis demo a couple of weeks ago and thereafter
decided to spend 100 DM on the Hannover fair to buy the pro version,
just to have an alternative to CAB, and to have a browser that doesn't
rely on a multitasking system.

And after one week, I think it's good, it's not optimal and may be
improved, but all in all it's ok.

Conclusion: Your statement is not totally false, but you exaggerate a
bit.

DV>Will it be free? I have no intention of paying these clowns one single
DV>penny anymore. If so, can I download the upgrade? with what? not with
DV>Adamas that's for sure!!
No, it's not free, even I (purchaser of the recent 1.63) will have to
pay the posting (twice).

PM>Yes, I know about the SCSI port. Do I need to modify the cable? I
PM>think this was required when connecting a ZIP drive to an ST, adding
PM>+5V to pin 26 or something. This is not true on the TT??
No, but maybe the ZIP drive has only one SCSI jack. That (if true)
will force you to put it to the real physical end of the SCSI bus ans
terminate it correctly!

It does work here. You have to run the emulator in "Atari disk mode"
and off course have a fully functional tcp/ip stack running. I'm using
STinG that works great with Gemulator. Note that there are "fast baud
rates" available. You should _not_ use hsmodem as the low level parts
are emulated and the old Atari serial speed cpx works OK.

>
>Just out of curiosity, why would you want it to? Isn't Gemulator an emulator
>for PCs? What does CAB offer that NS and IE do not?

There are other values of life than browser functionality ;-)

It apparently does filter mail, so why not upgrade your windows?

just for the the same reason I would have liked to have been able to do it from Magic PC ,despite lots of help and suggestions I never got this combo to work,I did however get it to work with Tosbox in 16 colour,apart from Cab 2.5 being ignorant of cookies and not scattering logs and records all over the drive of where and what I've been browsing,I get a kind of kick watching it "go" like it never did on any real Atari and in a dark room I can sit there and dream that I'm using a Falcon 060 or some other Machine Atari never made,it's one of those Atari things that's in my blood ,emulation the best form of flattery will keep an interest in Atari software long after the hardware has died

I will try this ,what surprised me though was that Cab wouldn't even load
and I would have thought it was written to run as I have on all sorts of
set-ups

2979. Sharing an Internet access between Falcon and PC ?

Newsgroup: comp.sys.atari.st
Date: 1999-11-28 00:00:00 UTC
From: St&#65533;phane Perez <stephane.perez3@libertysurf.fr>
Message-ID: <38408857.EB375DB7@libertysurf.fr>
Source record: 69852

Good evening,

I would like to share my internet access (using an external modem)
between my PC and my Falcon, with their parallel ports.

On Falcon I've got the very last STING version. On PC, I have
windozz 95B. I've got the adequate parallel cable (intensively
tested with Parallel Copy).

The problem is the STING configuration. I've seen the site of
Olivier Booklage (http://obooklage.free.fr) but don't understand
some things.
Here is my ROUTE.TAB file :

```
# cnx parallel port
192.0.1.0 255.255.255.0 Centr. PLIP 0.0.0.0
# masquerading
0.0.0.0 0.0.0.0 Masquerade 0.0.0.0
# cnx modem 2
0.0.0.0 0.0.0.0 Modem 2 0.0.0.0
```

Is there an error some where ?
Moreover, in the CPX for configuring the ports, I've set the
"masquerading" like this :
- virtual machine : 192.0.1.10
- masking IP (modem 2) : 192.0.1.11

I must admit I don't know a lot of things about TCP/IP... :)

If you can have more info, please tell it :)
Thanks !

> solution?

Interactive has ceased to do registrations which is a shame for many
shareware authors I just hope someone else can take up the cause,I have just
taken the risk of sending cash off to the author of Tosbox, it arrived but
not the best method as it was UKp so the author has to save up a few or try
and get a few beers for it at some bar, I use the latest Thing on several
Ataris and MagicPC and it works fine with long file names

> start off with the latest one?

I have used Thing for a long time and in my opinion one of the best value programs written ,I can't put dates to when I upgraded and had access to long file names via Magic and Magic PC ,the demo if you can find it works fully but with shareware plastered all over the screen,this should let you find out if it's what you need,

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for well over a decade, and with the latest release (8.1) it's turned shareware.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://uvk.atari.org.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me at cronos@atari.org and I will refrain from posting to the newgroup in the future.
Thanks for your time.

2987. ST News International Christmas Coding Convention 2000 (Atari ST/TT/Falcon scene reunion)

Newsgroup: comp.sys.atari.st
Date: 1999-11-28 00:00:00 UTC
From: Richard Karsmakers <richard@fortysecond.net>
Message-ID: <pks14scmffnvi88mnmo6rvlljnqakve7f2@4ax.com>

Are you a member of the former Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990?

Then you should not wait a second longer and surf over to http://stniccc2000.atari.org to discover that, in fact, a reunion of that very historical event is being organised for December 2000, a 10th anniversary reunion as it were! It is going to be the coolest event of the millenium, I can assure you!
In case you've already surfed over to that site in the past year or so, be advised to check it out again, as it's been overhauled utterly! It looks way cooler now, and contains a lot more information!

2988. Re: Sharing an Internet access between Falcon and PC ?

>On Falcon I've got the very last STING version. On PC, I have
>windozz 95B. I've got the adequate parallel cable (intensively
>tested with Parallel Copy).

Are there any Windows drivers for plip? I got the impression you would need Linux on the pc side?

First try to get a tcp/ip link between pc-Falcon without any masqerading. When this works it's easy to setup the masqerade part.

When I tried to link Linux/Mint to STinG with ppp there were lots of problems. This was last June so things may have gone for the better. If possible try with SLIP first.

I do have a very reliable ppp link between my Win-95 pc and the TT here via seral cable. I have to start "Remote access" on the pc side first and then activate the port in STinG. The opposite does not work.

>Here is my ROUTE.TAB file :
>
>## cnx parallel port
>192.0.1.0 255.255.255.0 Centr. PLIP 0.0.0.0
>## masquerading
>0.0.0.0 0.0.0.0 Masquerade 0.0.0.0
>## cnx modem 2
>0.0.0.0 0.0.0.0 Modem 2 0.0.0.0
>
>Is there an error some where ?

First you need ip-addresses for your ports. I would use:

Falcon: 192.168.1.1 . Set this in "STinG port setup" cpx for the plip port. Don't forget to set protocol (ppp/slip) and mtu at the same time. This port has to be manually activated.

Pc: 192.168.1.2 to be set on the pc itself.

If you activate "Add default route through port" in the STinG dialer configuration pages yuo don't need any default route in ROUTE.TAB . My ROUTE.TAB would look like this (with real TAB:s instead of spaces):

192.168.1.0 255.255.255.0 Centr. PLIP 0.0.0.0

That's all to get the local connection. When this works try to add masquerading:

>Moreover, in the CPX for configuring the ports, I've set the
>"masquerading" like this :
>- virtual machine : 192.0.1.10
>- masking IP (modem 2) : 192.0.1.11

It's best to simply keep the preset addresses as these will work just fine. Note, you should _not_ activate the masquerade pseudo port. It will be activated by the Dialer when you get online. Modem 2 should not be activated either. Also you must select "Use masquerading" in the Dialer setup pages.

You must set the nameserver numerical address on the pc by hand.

Please note that the only file you must edit by hand is ROUTE.TAB . In DEFAULT.CFG you may also want to raise ALLOCMEM to 150000 or so. Everything else is entered in the program dialoges.

Does not have to be short Nick - I am using a 2m cable from Best
Electronics to connect my SCSI tower to ther Mega ST4 and there has
been no problems - it must be a good shielded cable though - this is
nearly 1.25cm thick and difficult to bend (carefully)

Yes, I know about the SCSI port. Do I need to modify the cable? I think this was required when connecting a ZIP drive to an ST, adding +5V to pin 26 or something. This is not true on the TT??

Hi Martin,

>>Do you mean that they actually held a gun against your head *forcing*
>>you to update CAB? That must have been a scary and dreadfull moment...
>
>As usual you see things I haven't said at all. What I ment is that I
>don't like it that they make some products MagiC only whilst there isn't
>any reason at all to that so.
No one is forcing anyone to buy their products, If you don't like MagIC which is your full right, don't buy it... some of their products need to be *MagiC only*. It can't be helped that other OS's just don't offer the same functionality.

>That's what I call forcing people to buy their products (a Micro$oft
>trick).
Try to get addons for a Ford car in a GM shop.
Try to get parts for a Philips televison from a Sony dealer.
Try to get your Atari repaired in a Amiga Center
Why are ink cartridges from different manufacturers not interchangeable?
etc....

It's not a trick, it's common business sense...
A program is guaranteed to run under MagiC OS, without problems using all the functionality from this OS. Using it on TOS would severely hamper its capabilities. And not running under that *other* OS, what do you expect? You want commercial software that supports PD-freeware? perhaps in your wildest dreams but not in reality... the ASH programs are commercial, written by programmers who want to make a little money, the day that the *other* OS has enough users *willing* to pay for their programs, they might consider writing applications that take advantage of it.
Wake up..

It's only you and a small bunch here, who thinks like this. I don't really care under which OS my programs runs, I simply want the best. The day that the *other* OS, offers me more then MagiC.... I'll switch. Of course then there must be spreadsheets, databases, graphic applications etc.. that give the "MagiC only" applications a good run for their money.. where are these? who's gonna write them? when?
Wake up ...

>I only said that I don't like the way they are doing business.
>Sure they are doing something good but remember ASH is not a
>software house. Without ASH the authors of the different programs
>will still be there.
Wake up again...
Cactus Software (Kobold) is now distributed by ASH, so is NVDI from the

Brothers Behne and since spring even Papyrus from ROM. Do you think that all of them are *forced* by ASH? Writing software is one thing, getting it sold another one... distribution, manuals, packing and support is something that the authors don't have to worry about, and they know that ASH will promote their software in the best possible way.
Who's gonna take over from ASH? the clowns from MuCS, or perhaps Woller? ROTFL :-)))
Yes, the ASH authors will still be there, and pack it in very quickly if you ask me... a good example is France, since "la terre du milieu" and "Parx" have stopped hardly anything comes from there anymore. What happened to the French programmers?

Cheers from Belgium
Dennis

It's not needed on the TT, only on some ACSI<->SCSI-adapters that doesn't
have termpower.

Joe,
Sorry for my confusion but what good is a 56k connection if there's no
improvement in the download rate (as in CAB) compared to a 28.8 connection?
John

Bonjour :)

Iphigenie is upgraded to 1.3 version

new functions :
- DSP reset
- bubble Help, alerts and ST-Guide documentation
- Internal speaker monitoring and managment
- bugfix with Alice

For the new comers, Iphigenie is a Falcon SoundSystem monitor and manager. can be launched as APP or ACC.

The program is in French, but if some want it in English, I will translate it. Maybye you can ask TransAction for this, so I will have time to code or upgrade something else ;-)

bye

For using a Atari computer to download pictures from the Olympus
Digital Camera there is: Olympia.

It does not work with single TOS
it does need Wdialog
It needs ST Guide for reading the manual
It needs CAB
It needs multitasking but only MagiC works.

For such a simple task: downloading pictures from serial to disk I
need to buy how much software?
And they ask DM 90 for that Olypia piece.

Before I start I am new to this group and yes I am M$ using bastard. I hope everyone can guide me if I am not using 80 width columns.
That said we have come to a point where we are becoming as dumb as the software will allow us. Microsoft has built it's empire on morons. It enables any idiot to buy a system and within a very short period of time be up and running with a fair amount of proficiency. The downside is we have removed the knowledge required portion of computing and gotten lazy. We don't make our columns standard width because we don't need to. The software does it. So why is this a big deal? Because we use standards in order to make everything in the world go round. Imagine if you went to the store and every label was in a different language. Or you hook up to cable television and your set doesn't work. Standards are in place to allow EVERYONE to participate as long as they are a team player playing by the rules. If we can't adhere to the standard then we shouldn't be allowed to be a participant.

Hi Jeff:

On 27 Nov 1999 10:32:27 , Jeff Jewell wrote:

>Sounds to me like you should be bitching at the author of your software for not
>adding pretty basic functionality.

Actually, I have talked to the author some 18 months ago about this possibility. Other readers have incorporated an internal wordwrap to handle messages sent by incompetent people:-). Clearly you have managed to post a message in 80 columns. Something which I am able to do. Also having just read the post from Bill (guilty as charged:-), he politely changed his posts from 90 to 80 columns. Now John, author of NEWsie had no intention then of adding such a feature, that should be unnecessary.

It is Microsoft that has broken the convention. Back in the days of terminal emulation if you started sending messages greater than 80, you knew the flames would fly.

I don't complain to anyone really. John, IIRC, doesn't intend to implement a wordwrap or sidebar scroller. Now it is also pretty basic to post a message in 80 columns particularly if your editor has wordwrap, which mine does. I can go longer, but that would be rude. Clearly hundreds upon hundred of posts are sent into this newsgroup that are 80 columns.

So yeah it is pretty basic, and easy for either side to accomodate.
And there are other NEWSreaders which have accommodated this on the Atari.
I use NEWsie and there are others that don't. And since this is
an Atari newsgroup perhaps sticking to convention is not such a bad thing.

>The world's not going to slow down just because you still want to use
>decade old hardware. I love my Ataris, and I know I _can_ get them on
>the 'net, but it's a lot easier and a much richer experience to access the
>'net in other ways.

The world slowing down? This is a Newsgroup. Hardly something that is on the cutting edge of computer technology. It hasn't changed in 2 decades. People could go over 80 column back then, too, but they didn't, for fear of flaming reprisals and being considered a newbie who doesn't have a clue.

The hardware has little to do with this, nor does the software.
I am in an Atari NG using Atari Hardware and Software for the task at hand.
Sounds to me like MS has abandoned basic functionality. It is you who should be disapointed:-). However more to the point is you can't change the world. There are more Newbies showing up then there are flamers to keep them under control. Soon I should be happy seeing binaries show up here as

well because it happens in other NG more often than should.

Now what you use is a superior package. Perhaps I should just buy a Pentium loaded with MS software and the world will be a better place? I will still get triple sent emails that take more time to receive, and as I don't have a cable modem, or isdn, then this is time consuming no matter what the computer as our phone lines operate a 33.6 in this area. Downloads are no faster on a pentium than on an ST with serial mod. And they are not that much faster than a STock ST at 19200. But the mail remains a pain in the ass. Even as my many computer friends in the industry will attest no matter the computer used. Idiots don't enrich anything. And I don't mean to say that anyone in this NG is an idiot. Actually it is the opposite.

But I just finished showing my MCSE friend what an IDIOT he is for sending me mail in such a fashion. He also acknowledged that 80 columns is the standard and people should be aware of things as such.

However the fact that a newsreader will reformat the text is a benefit when such errors occur. (Particularly if they are the fault of the Emailer, NEWS program that created them).

Will I get a Windows Based computer? Well no. Are they better than the ST/TT/Falcon? I would say so. Is there internet package better? Sure it is.

Why then would I use an ST? Because I can, thats why. Nothing gave me more satisfaction than to see my original ST that I purchased in 1985 pulled out of the closet and connected to the internet after a 7 year hiatus. Decades old hardware, this is an amazing feat considering the technical advances that occurred in the Industry. And My ST is TOS 1.0 at that. Even the Falcon isn't that much faster than the ST, only the Web Pages look better:-).

No the worlds not going to slow down. To many people I know are getting rid of there 2 to 3 year old computers. I have been there done that. You want to spend $1000 every 2 to 4 years, be my guest. I am getting Falcons and TTs now and they are affordable. Something they weren't when they were younger machines.

Ataris are my hobby now, not computers. And this Atari is an excellent machine that manages to do the job. Your solution is to change computers. I could simply run another NEWs program whether it be STing/MINT or Iconnect based. This is not a difficult solution. Not difficult at all.

Nor is posting a message in 80 columns not that difficult.

Its not like it is video streaming.

Later Brian.

>Excuse me? NEWSie and other Atari TCP/IP software is 3 years
>old, at most, at least when it comes to STiK/STiNG stuff. Also,
>MiNT-Net exists only since 1994.

He is mistaken between hardware and software. Both are capable. NEWsie is
not even version 1 yet, and an update to .96 is RSN. But I don't believe
there will be wordwrap. I really don't think Jeffs argument is strong in
this regard.

>> I love my Ataris, and I know I _can_ get them on the 'net,
>> but it's a lot easier and a much richer experience to access
>> the 'net in other ways.

>Richer?

???Richer, This is more wealth, Like MONEY. You will be RICHER Qfunk if you
purchase a New computer and load it with M$ products.

Richer, is when you dig your ST out of a closet, connect it to the internet
and put the $1000 you would spend on a new computer into Mutual Funds and
not directly into M$ pockets.

>Like what, getting a 12KB email containing 3 words, repeated
>three times as plain-text, html, and RTF, just so that idiots
>using M$ products can read it over a strawberry background?

strawberry? Strawberry. STRAWBERRY! I LOVE STRAWBERRY!!!

Clearly now I am swayed. I have had it all wrong.

Your forgiveness please:-).

I remember when you said this too. Luckily this NG isn't loaded with HTML
like others. Luckily most 99.9% tend to post at 80. Those that are aware
that this inconviences others soon adapt to 80. Everyone wants there posts
in this NG to be read. This isn't your regular run of the mill newsgroup.
This is one that has a well informed readership. And every here really is
on the same page, even if the sizes may be different:-).

>And Microsoft may be the devil, but there are an enormous number of people using

>ignore them just because their messages aren't preformatted.

As I said earlier, I would be very very very unlikely to bring this up in
another NG. Most Atari Users for some reason are more informed of net
etiquette, than most users and we are in a computer NG.

Now when I am on comp.sys.barney.com I am much more leniant:-).

I think net etiquette disappeared along with good table manners?

Take Care Terry.

I found a local electronics store that has a large quantity of the 19 pin connectors male and female connectors. I think they sell for 2.19 each. I could be wrong on the price. If anyone needs these connectors drop me a email and Ill pick them up for you.

Don

3017. Anyone familiar with the Atari PC (8086 IBM compatible)?

Newsgroup: comp.sys.atari.st
Date: 1999-11-28 00:00:00 UTC
From: eastman@nortelnetworks.com
Message-ID: <eastman-2811991329070001@47.221.35.6>
Source record: 69890

I usually have no interest in PC's, but I picked one up because it was made by Atari. The main unit looks like a Mega ST. A web search turned up this reference:

http://www.computingmuseum.com/museum/ataripc.htm

Mine came with monitor, external floppy and mouse but no keyboard or software. It seems to boot fine to the point where it needs a disk.

Does someone know the Atari model number of the original keyboard? There's a round, female 5 pin DIN keyboard connector on the back of the computer. Will other PC keyboards work?

Was there a special Atari version of DOS or should any MS-DOS boot disk work?

Thanks.

3019. Atari MegaSTe 4 for Sale

Newsgroup: comp.sys.atari.st
Date: 1999-11-28 00:00:00 UTC
From: Don Schmidt <dschmidt@pacifier.com>
Message-ID: <38417d8f.0@news.pacifier.com>
Source record: 69892

The time has come for a new owner for the Bear Cavern BBS's equipment.

The following Atari equipment and software are for sale for $500 plus handling and shipping.

Optional: Will include an APC BackUPs 400 UPS for an additional $40 plus handling and shipping.

1 Atari Mega 4 STe equipt with 50 MB hard drive, Ajax chip, 1.44 floppy drive. With a JinMouse (better than an Atari Mouse).

1 Atari 14" swivel base monochrome monitors.

1 Atari SC1224 color monitor.

1 1.1 Gigabit Seagate SCSI Toad Tower Hard Drive with Adaptic card.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
This hard drive is the one used with the BBS and contains several hundred Atari, MSDOS and Windows files.

1 540 MB Quantum hard drive with an ICD II adapter.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
Built in the same box, a 750 kb floppy drive. The floppy is good but the cord length makes it unreliable. Best to remove it and use it as intended.

The BBS software is BB/ST by Quantum Microsystems. Old but reliable.
The program has been improved by Anthony Watson (Mountain Software), improving the file library and the File attached Mail.

Maintenance software on the BBS includes, Diamond Edge, Diamond Back, ICD Pro Utilities, SCSIWAIT 3.

Two external SupraFAXmodems, 1 v32.bis and the other 33.6 (these are the ones with the display)

Dozens, if not hundreds of 750 kb disks with commercial software, Magazine files, and STReports downloads and manuals. (Also the Best Electronics catalog).

Cords, powered monitor switch (will switch from one monitor to another including the AC)

Mega STe Field Manual

Lots of software

From: Jan-Frederik_Daldrup@kr.maus.de (Jan-Frederik Daldrup)
Date: Sat, 27 Nov 1999 07:55:00 +0100

Hi Jan-Frederik

>DV>Is this some kind of joke? German humour perhaps?
>
>Yes, it's some sort of running gag. Probably just for insiders but we think
>it's quite funny.
Well, I for one I'm not amused...

>Wow! I haven't seen that much program bashing without one bit of constructive
>criticism for months. Just had to quote the whole text again as it is quite
>impressive really...
Do You think so? I thought I restrained myself pretty much...
Did I mention the manual? did I mention the shitty ACC? did I mention the
install program? did I mention the support ?

Sorry Jan, there's *absolutely* nothing about Draconis to be positive about.
It's like a timewarp, I thought I was back in the late eighties. Draconis just
isn't good enough compared with today standards.
Instead of debugging/updating it I suggest they forget all about this program
and start again from scratch...

Beam me up, Scotty !!

Cheers from Belgium
Dennis

In it's time when such devices were made, it consisted of plugging in
and copying a file to the auto folder. Even these devices often require
their own driver to be installed because window wont find or install
them correctly. Hell every know and then when I boot up with win98 it
still finds occasional nonexistand hardware. it once found a digital
camera, I thought I had one a prize.

Unsupported software has nothing to do with the OS. A browser is an
application not an operating system.

Connecting the st to the internet wwas just as easy as connecting the
pc, what is the differnce between inserting numbers through a wizard, or
a small documented text file, it is still inputting the same info given
you by your isp in the same location.

Some enterprising programmer out there could probably create a small
gewm based wizard to install sting and configure the damn thing it only
two small ascii files and a few program files to copy. I cannot do this
because i don't know how and don't have the tools to.

You are comparing using a computer and adding peripherals that were made
for that computer and systems which are setup at the factory to adding
peripherals to a system which those peripherals were not made for. The
fact that you can even use the ST on the net and add in the newer
peripherals is amazing.

The point was that uncle Bill did not make computers easy to use, that
was done by Atari/apple/commodore.

Bill Gates is a crook as you have described yet the vision of a computer in every household wasn't happening as was predicted. He made things so easy for the people who have no computer background and don't want to spend any time learning. The stuff atari's can do was amazing when it was current and in a few cases isn't far off what systems are doing today. What Bill did was to market the stuff effectively at a new segment which didn't have much if any computer knowledge which in turn helped to sell PC's. The winner in the marketplace is often not the technological best there is out there. If Atari had been as successful in marketing their products there would be current product kicking everyone's ass. But unfortunately they weren't and now more than a few have become footstools much to the dismay of people in this NG.
Uncle Bill is the devil but look at how many were interested in what he was selling. Techies will always love the cutting edge of technology but the average couch potato would never have bought a computer until Bill made it easier to use than programming a VCR.

Steve

>first model had an internal PSU, but I wait to be corrected on that
>one :-)

Well not exactly. I have a nice collection of 520STs.

520ST, TOS on Disk, No modulator, Ex PSU, Ex SS Floppy
520ST, TOS Rom, No Mod, Ex PSU, Ex SS Floppy
520STM, TOS 1.0, Mod, Ex PSU, Ex SS Floppy
520STFM, TOS 1.0, Mod, In PSU, IN SS Floppy (Short Run)
520STFM, TOS 1.2, Mod, In PSU, In SS Floppy (Short Run)
520STFM, TOS 1.2, Mod, IN PSU, IN, DS Floppy

Sorry, don't have anymore at hand:-).
For some reason 520STs were very popular in Canada.

The 1040ST is somewhat different.

I haven't seen a 520STF, with no modulator.

I wait to be corrected :-).

but you can find:

1040STF

followed by:

1040STFM

Later Brian.

Source record: 69753

Well, I'm back at work after a great Thanksgiving. I spent a few hours with STing to no avail. I did install the latest versions of STing -- the results are identical.

Kenneth,

I did completely reinstall STing (CAB 2.5 too). I'll make the changes you suggested to the CPXs and the autofolder order. Could you elaborate on how to change SCC.PRG? I have the SETTER.PRG, but things are a bit hard to read if you don't speak German.

Joe,

I suspect that my problem may well be in the configuration. I'll try your numbers.

Tony,

I believe that MFP_FALC.PRG is for Serial 1. I'm using the original MODEM2 port.

John,

I emailed you today from work hoping for your .CFG file. Couldn't hurt.

Many thanks to the people that have responded. I really welcome your ideas. I once had CAB running (single-tasking only) fairly well, and I have no idea what I did to "break" it. In case you have a few brain cells to dedicate to my dilemma, here is what's occurring:

Regardless of whether I'm on a stripped system or not, the Dialer seems to connect fine. When offline, CAB has no trouble with any HTML file I throw at it either. Once connected, however, things move as slow as molasses. Downloading a page may take 10 minutes, and clicking on the scroll bar appears to lock up the computer. Often, CAB merely times out. The problem does not seem to be limited to CAB. MyMail notices I have mail almost instantly, but it takes a good minute for the "Get Mail" button to come up, and once clicked, the mail never comes. Newsie is able to connect to host, but tells me "0 bytes recieved" for a long time. Sometimes something comes, sometimes not. Picture an Atari running at 0.4Mhz with an unstable OS and you've got my condition (Hmm, just described a 486 :-)). I doubt this is a hardware problem, since I can use every other program I own (including BBS software). I doubt this is a CAB problem, since it runs fine under Geneva so long as I'm offline (CAB doesn't really care where its data is coming from). That makes it a CAB.OVL, or more likely, a STing problem. The fact that you guys are successfully running Geneva/NeoDesk/STing/CAB means I

should be able to as well, at least in theory. Sure is driving me
crazy, though.

SCSI or parallel version ?

With the parallel, it's out of question. You would need a cartridge port adapter
that costs the price of a new drive, and you need to order it in Germany.

With the SCSI version, it's pretty straightforward. Check out the Quick FAQ.

There is a limit under Magic (under Mac OS too, for that matter).
I believe it's thirty-something characters, so you're OK unless you get
rather carried away.

Hi Folks...

I need a Legal copy of Cubase v3 (or higher) with a manual and dongle.

I'm offering a Roland PC200 controller keyboard , it's boxed with manual (but the box is a bit scruffy)....alternately I'm offering a pair of Vestax micro-rack FX and a PSU and a 19" rack bracket (home made) for them...there's a chorus and a flanger, they're both analogue....

Personally, I found setting up my scanner and my CDR to be as simple as
placing a folder of software on the hard drive. "Idiot-proofing" =
good programming. In my ideal world, all software can run out of a
folder placed anywhere with the possible exception of a little "AUTO"
program that points to the desired folder. Most Atari software can do
that, so keeping track of things is fairly easy.

Hi Steve,

I fail to see your point on how msft made computers easy. Is windows
any easier to use than TOS/gem, or and amiga or an apple. He promoted
it to the masses but but didn't make computers easy. Have you ever used
MS works. I still cannot figure it out.

3042. Gemulator with Falcon TOS

Newsgroup: comp.sys.atari.st
Date: 1999-11-29 00:00:00 UTC
From: Bill Platt <virtb@bellsouth.net>
Message-ID: <384313B8.31B107F0@bellsouth.net>
Source record: 69765

Another post in this NG promptem me to d-load Gemulator. Has anyone used TOS 4.04 with this. The idea is great, but the 16 color limitation literally makes the program useless for me. Although the idea of a super fast ST is pretty cool, it would be nice to take advantage of the PC's 32bit display. I ran Quick index on it and on a 366mmx, 800x600x16 color mode was roughly 2.5x the speed of a TT.

> Before I start I am new to this group and yes I am M$ using bastard. I hope
> everyone can guide me if I am not using 80 width columns.

The problem with 80 columns for composing is that it doesn't take long before articles exceed that number due to multiple levels of quoting. If someone was to do a followup to this article and include whatever was originally quoted, the line length would probably exceed 80, depending on the quote character(s). Even though you're adhering to the 80-column standard, there's very little room left for the quoting itself (not to mention the vertical scrollbar on smaller screens).

Using rewrap, what was quoted above would appear as:

> Before I start I am new to this group and yes I am M$ using bastard. I
> hope everyone can guide me if I am not using 80 width columns.

This now allows room for subsequent quoting, and wouldn't have been necessary if your newsreader was configured to use a smaller line length.

My experience with three different Atari newsreaders is to use 72-74 columns. With followups, quoted text that grossly exceeds the standard can be fixed by using a good external editor: Many Atari users have qed installed as their newsreader's editor, which means macros can be written to reformat quoted text so that it adheres to the standard.

Not to criticize Brian, who started this thread, but if he's complaining about articles over 80 columns then he shouldn't propagate such posts in his followups. Why pass along bad practices. It's encumbent on the newsreader and the user to make sure standards are adhered to.

Agreed. But what good is an OS without software? And isn't part of an OS' job in supporting peripherals?

>Connecting the st to the internet wwas just as easy as connecting the
>pc, what is the differnce between inserting numbers through a wizard, or
>a small documented text file, it is still inputting the same info given
>you by your isp in the same location.

It's a big difference. First you have to assume the person can find a text editor, and can figure out where all the data files go. And even if he gets that right, it's very easy to screw something up with a text editor. With a wizard, it's really hard to screw something up unless you just give it incorrect information. And then it's real simple to fix that.

>Some enterprising programmer out there could probably create a small
>gewm based wizard to install sting and configure the damn thing it only
>two small ascii files and a few program files to copy.

Agreed. But since that hasn't happened, it remains relatively difficult to install (at least compared to the Windows equivalent). The commercial version of CAB with IConnect is much better, though.

>You are comparing using a computer and adding peripherals that were made
>for that computer and systems which are setup at the factory to adding
>peripherals to a system which those peripherals were not made for. The

That's my point. It's simple to use because it's very limited in what it can do. My calculator is very simple to use, too. That doesn't make it a great computer.

>fact that you can even use the ST on the net and add in the newer
>peripherals is amazing.

You mean SOME of the newer peripherals. Yes, it's pretty amazing what people have made the ST line do. But technology is still leaving it behind.

>The point was that uncle Bill did not make computers easy to use, that
>was done by Atari/apple/commodore.

And the point is wrong. "Uncle Bill" has also made computers easy to use. He may not have been first, but neither was Atari/Apple/Commodore (though Apple was probably the first to deliver [what they had stolen from Xerox] to the public).

Why do you want to give Atari credit for basically copying the Mac, but you don't want to give MS any credit for doing the same? Is it because Uncle Bill did a much better job (at least in marketing) than Uncle Jack?

Let me put it this way. If I want to buy a new scanner, I know I can go to any computer store and buy virtually any scanner on the shelf (assuming I have the needed port). I know when I get home I'll have it up and running in 5-10 minutes. I don't have to worry about finding software or a cable or figuring out how to make it work on my computer. That is idiot-proof. More importantly, it's user-friendly.

Same with a CD-R, though installation will take a little bit longer than the scanner. But it's just as simple, and again, I don't have to worry about cables or software or anything like that. It's basically plug and play.

I'm not saying you need a degree in engineering to make those installations on an Atari. But to suggest that it's even remotely as simple as it is on a Windows machine is just silly. It's not even close.

Regarding running software out of a folder placed anywhere, virtually every Windows installation program I've come across allows you to choose where to install it. It usually defaults to C:\Program Files\whatever, but it's very easy to change it to where you want it. So I'm not really sure what you're getting at there.

Can it handle 128-bit encryption? I believe that's required to do online banking. Cookie support was also very iffy in my experience (I never could get on 800.com, for example), though that's probably better in MiNT, too.

Of course, if your site requires Javascript, you're screwed anyway.

>> but the cable has to be short.
>
>Some people find 19-pin connectors difficult to find, Nick.

In dire need, if absolutely nothing else is available, the 19-pin
D connectors can be made from 25-pin ones. One has to cut the metal shield
in two, extract the plastic core, shorten it to 19 pins, and then also
shorten the metal shiled, solder its part together around the core, and
finally tidy everything up with a little file.

But it is a much better idea to try to find real 19-pin connectors...

By the way, not every shielded cable may be suitable- i came upon a
specimen once that, although everything was properly connected, caused a
lot of errors in hard-disk operation. A matter of unmatched impedances,
probably...

Hi John,

JG>Sorry for my confusion but what good is a 56k connection if there's no
JG>improvement in the download rate (as in CAB) compared to a 28.8
JG>connection?
none, of course.

But the download rate depends of your correspondent's modem and on the
quality of the line.

My favourite BBS answers me with 28k8 only, so my download rate is
about 3250 cps, for upload it's a bit higher.

But some BBS answer with more, e.g. 33k6, and T-Online (Deutsche
Telekom) answers usually with 49.333, sometimes with 50.667, and
sometimes with less than 33k6.

There is no need to buy a 56k modem if you own a 28k8, but if you buy
one, you should ask for the best, and on the analogue way that's 56k.

> one particular OS be it N_AES, Geneva or Magic.

Not THIS argument again!! (GRUMBLE!)

ASH are considered by some to be the Micro$oft of the Atari world.
Sure there is software that is MagiC only, but there is also quite
a bit of software that is MiNT only, like MiNTnet etc...

The comparison with M$ is completely unfounded. My advice is for
people who hate MagiC and ASH to stop grumbling. At least you can
choose a different OS if you want to (try finding a PC retailer
who sells an OS other than Windows, and software that doesn't need
Windows)...

Pots are allowed to call kettles black, but isn't it kinda
pointless don't you think?

: The what? TT? If so I wasn't aware of that, because it appears that the
: internal bus have.

Some ACSI - SCSI adapters like the ICD Link are powered by the SCSI
TERMPWR wire which is normally used for powering the terminator. The issue
with certain SCSI devices like the Iomega Zip drive is that they don't
connect TERMPWR so the Link does not get any power.

This is entirely irrelevant if such an adapter is not in use. And yes the
TT's SCSI port does provide power on TERMPWR.

The words 'GETS THE JOB DONE' spring to mind. People can say that an
Atari app
is a crock of shit because it doesn't load Word docs etc...but I don't
see Word
loading many 'foreign' doctypes compared to a decent DTP/WP app on Mac/Amiga
Atari etc...

> >addition there are fantastic Atari/Amiga/Mac based apps that will never see

Funny that. I know nothing of Best Buy (they haven't opened in, or maybe
even heard of!, New Zealand) but if they are a typical retail chain they will
have a PC section and a Mac section for their bread and butter. The
comment was
passed that not much Amiga/Atari software was seen there...considering
the much
smaller size of the Amiga and Atari markets is it any wonder? Smaller software
and distribution houses are there to fill that gap...

> The vast majority of computer users
> use Windows, ergo, the way to make money is to sell Windows compatible software.

I'd (logically) would exprct the download rate to double if the connection
rate doubled (like I said, logically). That, taking into consideration
all the variable modem parameters (at least on the Supra 28.8; not on the
Supra 56k), line conditions, ISP state and all the other interconnections
involved!!! However.........

I assume your Atari is newer? I think the arguments are pretty clear so far. You seem to be in 80 columns. I am comfortable with that:-).

>> Like what, getting a 12KB email containing 3 words, repeated
>> three times as plain-text, html, and RTF, just so that idiots
>> using M$ products can read it over a strawberry background?

>Richer, like talking about something Atari related and useful instead of
>whining about how Bill Gates is personally ruining your life.

hahaha! Actually this is not only NG related it is also Atari related. There was no whining from anyone, except perhaps yourself who seem to be taking this personally. I should hope not. You need not defend software that doesn't conform to standards. And clearly you use yours according to the standard.

>ps - so, what, this fantastic three year old software can't filter mail,
>either? Wow, where should I send my shareware donation?

ALL Atari internet software I am using is Freeware. No donation required.

I use CAB 1.5 and 2.7 Demo.
STing for PPP.
and NEWsie .94 for NG, Email and FTP.
MICQ for ICQ:-).
AtariIRC.
and we can go on.....

Pretty good deal. Software problems are discussed with the Authors in many cases, and duly resolved. All these programs can work with a TOS 1.0 computer. And TOS 1.0 has many bugs. 40 Folder being one of the worst.

I am talking Atari. If you wish to add anything Atari related, I have no objections.

There is an emulator thread going on. I have no current interest in emulation of Atari just yet. However there is a very interesting discussion occuring to this effect.

"Why would you want to run STing and CAB on Gemulator when there is IE or NAV."

"Because there are things more important than Web Browsing at its best."

"Like what?"

"Emulation."

I think this abstraction represents how I feel about using an Atari on the Internet. There are things more important to me, than using Windows to access the internet, and that is using all my Ataris to do this.

One could argue that every piece of software and hardware today is superior to what is used on the Atari. So following your logic, why use Atari at all?

You use Atari for something, for what I am not certain, but I am certain, of this. It is most likely Decades old hardware base around a 68000.

later Brian.

>(again, many of whom are very intelligent) is not going to stop because you
and
>your little elitist group want it to.

Well to start things off it is an standard adhered to by everyone. Imagine what would happen if no one adhered to the same standard for TCP/IP. I might be able to contact my ISP but if everyone else decides to ignore the standard I wouldn't get very far on the internet would I?
I was a bit harsh in using the word moron. It was a blanket statement meant to insinuate that some computer users are morons. Some of the people in the group are mearly uneducated in proper etiquette and the rest are in fact morons. I fully admit I am one of those people at times but I feel it is my duty to rectify actions of bad Netiqiuete or else become one of the morons. I have been accuse of sending HTML mail but rectified it as soon as informed of it. When I read the message here concerning going outside the 80 column standard I made sure I wasn't doing it.
As for the elitist group name calling. Come on lets stick to the topic.
I am a M$ user and have to give uncle Bill credit for making an OS that non-computer types can readily learn and use. It is not perfect yet for someone not highly educated in computers it makes them finally easy to use. Unfortunately that ease of use causes many people to miss out on what is really going on behind the GUI. They don't realize that they are sending HTML mail or 100 character lines which is not acceptable to many users.

Steve

Something is really confusing here.

We all started using ST's because of their ease of use versus using DOS. The arguement at the time was that the Atari ST was better because it was easier to use.

Now 13 years later uncle Bill has created an OS that non-computer types can readily learn and use. I don't want a flame war to start, but this is the most ridiculous thing I have ever heard. What could be so complicated about using an ST. You don't even have to install programs, just unzip and click on the file called*.app or *.prg. ST's come about as idiot proof as a computer can come, esp if it is floppy based.

Even Falcon TOS is pretty much idiot proof and it doesn't have to be placed on a cd rom or 25 hd floppies to be used. If uncle Bill did anything, he took the concept of a GUI, hacked it onto dos and added every possible utility imaginable.

What exactly has uncle Bill created. he stole the best of what he could and and through racketeering, conspiracy, and extortion has made himself the richest man in the world. Italian guys named Gotti in new york city go to jail for this but some geek in washington gets a pat on the back for being a marketing genius. What is wrong with this picture. A crime is a crime in the USA and gates and co should be doing time. The only problem is that MSFT is a corporation and takes all the blame, and you cannot place a corporation in jail. He owes you $40 bucks for ripping you off on your purchase of a PC as well as everyone in the world. When the class action lawsuits against msft start coming I will be signing up for my 40.

DOH! ;-P

I stopped participating in NEWSie beta-testing (and other STiK /
STiNG software) around version 0.80, because STiK/STiNG could not
do PPP and local ISPs in Quï¿½bec were all abandoning SLIP.

I installed KEMD, after 2 months of waiting for a stable STiNG
with PPP (it only came one out year later) and never went back.

At first, I used GlueSTiK a lot, but seeing as Pine had better
functionalities than NEWSie and CAB.OVL plus aFTP also existed
for MiNT, I haven't used it in ages.

The first ST didn't have an internal PSU, floppy. or RF modulator (i.e. no TV output). STM meant ST with internal modulator, STF meant ST with internal floppy, and STFM meant ST with both. I think all but the very first model had an internal PSU, but I wait to be corrected on that one :-)

I didn't mean to suggest that Win98 is rock solid. It's not. I was just saying that it's easy to use and installing hardware and software is generally a breeze.

I've been using Win2000 for a few days now and absolutely love it. Can't wait for the release version. Nice to be using a real OS and not a DOS shell. It's not only faster, but much more solid.

>...or thats all they have previously seen advertised because of the aforementioned
>exclusive contracts...

I think people are more worried about software than about their OS. If their OS doesn't run the software they want (and 90% of what's on the shelves is written for Windows), it doesn't matter how good the OS is.

>The words 'GETS THE JOB DONE' spring to mind.

But Atari browsers DON'T get the job done. There are many sites you can't get on at all. And others you can get on, but can't do anything functional, like online banking and shopping. And even when it IS getting the job done, it's slow as molasses on most Ataris.

It's idiot proof as long as you don't want to buy a new CD-RW, or DVD-ROM, or a new scanner or a new digital camera or a new hard drive or a new keyboard or any number of other hardware additions. And it's idiot proof as long as you don't want to do online banking, or online shopping at many sites where CAB fails (assuming the "idiot" can even get CAB up and running), or even get on many web sites.

Again, it's simple to be easy to use when you have a simple system. If you want to expand your horizons, it complicates things (though I wouldn't exactly call Win9x complicated).

Hallvard,

Since Joe has given up Interactive support, I guess you'll have to
register it direct with the author, Thomas Binder:

His address: Thomas Binder
Johann-Valentin-May-Stra�e 7
64665 Alsbach-H�hnlein
Germany

Email: gryf@hrz.tu-darmstadt.de

The shareware fee is currently 30,- DM for new registrants.
The update from Thing 1.2x is free of charge, but that from Thing 1.0x
on the other hand is not. If you wish to keep on using new version 1.2x
and were registered only for 1.0x, you have to pay an update fee of
15,00 DM. If you do not agree to this, you are free to keep on using the
old version of course.

Re long filenames:

� Full support for alternative file systems: Thing supports long,
case-sensitive filenames up to 32 characters in length, which may
contain spaces. Even the special attributes, such as are offered by
the Minix file system, for instance, can be displayed and altered
by Thing.

Presumably you also have to use a suitable file selector.

All the above is from the HYP, which I translated.

Regards, /Peter/

At least you know what's going on with an Atari. On a Windows system so
much happens in the background that trying to find out what's gone wrong
can be a nightmare (see below for explanation)

> Regarding running software out of a folder placed anywhere, virtually
every

you're
> getting at there.

Windows installers don't just copy/unpack files to a specified folder.
They also spray files hither and thither in your Windows and System
folders and lord knows where else, and make alterations and additions to

the registry. Which is why you're knackered if you haven't got an uninstaller for a program and want to get rid of it (eg with older software that doesn't play by the Win95 and later rules regarding uninstallers). If you just delete the folder where it has nominally been installed, you leave loads of other files in place and a bunch of registry entries which sooner or later cause problems as the machine goes looking for missing things. Uninstallers aren't foolproof either: often they'll suggest that some files may be in use by other programs so you then either choose to leave them there taking up space on your HD or get rid of them and risk something else not working.

In contrast, most Atari programs go where *you* decide to put them and stay there. Exceptions tend to be system enhancements such as NVDI or programs which need entries in the Auto folder etc. Even then things are usually much more obvious, mostly because in the majority of cases *you* put them where they are supposed to be. The exceptions can frequently be a PITA such as CAB's installer which won't install all of Iconnect without also installing OLGA, not necessarily in the way you want to install it either.

I don't see where that's any better on the Atari. Any system is prone to failures, and troubleshooting can be a pain. My point is that all else being equal, it's much easier to install new hardware on a Windows machine.

>At least you know what's going on with an Atari. On a Windows system so
>much happens in the background that trying to find out what's gone wrong
>can be a nightmare (see below for explanation)

I agree. One of the most frustrating things about Windows is not knowing what's what. I have countless files on my HD that I have no idea what they do, whether I need them, who they belong to, etc. On my Atari, if I didn't know what a file did, I at least knew to which program it belonged to.

But I've already stated that the Atari is a much simpler machine, because it does a whole lot less. With complexity comes confusion. I don't see any way around that. It goes back to my calculator analogy. Very simple to use, but not much of a computer. (I'm not saying Ataris are not much of a computer -- they're just not as powerful as modern computers.)

>Windows installers don't just copy/unpack files to a specified folder.

But I clearly stated both brought something to the table. That is, each
connects to some sites that the other does not. How does that equate to
choice for choice sake?

> simple as it is on a Windows machine is just silly. It's not even
> close.
The funny thing is, it is. My CD-R was a matter of taking the CDROM
out of my SCSI chain, plugging the CD-R in, and turning on the
computer. (Extendos Gold, by Anodyne). My scanner was a matter of
turning off termination on the CD-R, plugging the scanner in (O.K., I
had to go buy the cable, SCSI1-SCSI1 C50 style) and turning it's
termination on (it didn't work, requiring a pass-through terminator,
but that would have been the case on any computer -- Microtek fixed
this on it's next version). Well made commercial software is well made
commercial software. It works well.

I think you may have in mind the fact that Atarians are often forced to
use less than perfect software. My STing problems (see the proper
thread) are probably due to a configuration problem or program
conflict. STing, unfortunately, does not have a 24 hour help line,
full-time beta testers, or a long detailed WARNINGS file detailing
possible problems and how to avoid them. I wish it did, but it
doesn't, so I have to ask for help here and scratch my head a lot.
Hopefully, I'll get it working.

> Regarding running software out of a folder placed anywhere,
> virtually every Windows installation program I've come across allows
> you to choose where to install it. It usually defaults to C:\Program

If you want to make matters very unpleasant for yourself, uninstall a
program by deleting its folder. There are good reasons Windows uses
installation programs. Little files appear here and there, others get
changed, and all this is transparent to the user. I much prefer all my
files for an application to stay in one place and this is certainly not

the case with most Windows and some Mac software (It's not always true
for Atari either, though I wish it was).

same with the atari with the scanner, just takes longer coz you need to
get the driver separately. Cables are the same afaik. My scsi scanner and
other peripherals took seconds to install and get up and running.

> I'm not saying you need a degree in engineering to make those installations
> on an Atari. But to suggest that it's even remotely as simple as it is on a

many cases it is actually easier. (I remember when I installed the JAZ
drive, or cdrom or scanner, no IRQ conflict, didn't have to reboot the
machine 4 times in a row etc, it just worked) but well, maybe lucky on my
side.

> Regarding running software out of a folder placed anywhere, virtually every
> Windows installation program I've come across allows you to choose where to
> install it. It usually defaults to C:\Program Files\whatever, but it's very

> getting at there.
now whatever dude. This is not what he meant I believe.
He talks about self contain applications within 1 tree. Which in win95
world, of course you can decide where you want the main files to go,
However, once it is choosen, you are pretty much screwed. As in, let's
take YOUR example, Install a software on drive D, then you decide you want
to install a zip drive, or create a new partition, which will push drive D
into E.
Then try to run the previously install software.
9 outta 10, it will fail, coz it was installed to be ran in D drive.
SO what you do?
You can't just reinstall it over :)
coz you will then have conflict in your registry :)
so you have to uninstall it, but too late coz it won't uninstall 9 times
out of ten coz the drive is different.

So most likely you need to scan and manually edit your registry :)
good luck.
whatever

I'd be one of the first to admit that ASH's Emailer is err, quirky when it comes to setting line lenghts, hopefully no-one has found a problem with any of my posts, in that direction at least! :-)

> P.S. am I wrong now, some 18months after the last debate, to be
>fixated on this 80 column debate?

I don't think so. There's no reason why any emailer or news reading program cannot be set to provide line breaks at 70-80 columns which makes the posts readable to all.

I must say tho' that I've found standards slipping over the past weeks. Excessive quoting is really unnecessary - as a long-time BBS user I long ago learnt to just quote the part of the message that I was replying to, not the entire thing as we've been seeing recently.

Don't worry, you're not being rude. Of course it could be crap once it's connected online, but OXO do seem to be reacting to the very small Atari etc market in a positive manner, and I'm prepared to give them their due for that. I've 'mailed them re the graying out of printing, but will prob. get a key. I am not surprised that it mis interprets some HTML code, see my remarks re the Tables, but that IMHO is a matter of developing/tweeking the code. In my ignorance, it seems that it is more important that the core of the programme enables an overall higher speed of screen draw than CAB. But I could be completely wrong :)) have to see.

That's a compile option, so yes.

> Cookie support was also very iffy in my experience though
> that's probably better in MiNT, too.

Actually, no. The OVL for MiNT-Net was never upgraded to use
CAB's 2.7's own cookie cache; it stores cookies in RAM, but this
would be easily upgraded though.

> if your site requires Javascript, you're screwed anyway.

That's still true, unfortunately.

>see.

Bob,

I tested the previous versions and made a report in a Dutch Atari mag.
I had the complete "working" version, with a key that is.

The quick recap:
- Moving GIF's were either not displayed or didn't move
- some JPEG's appearently had problems too
- FTP stuff isn't working at all (no implementation, tho' they show up

in the menu's.
-Getting an "allgroupslist" was a mess.
- Using the mailer and newsreader for answers got a config file
messed up so the messages weren't shown any longer
- formatting of some text in a html document didn't work right
sometimes, neither were tables shown OK. You mentioned
that one too.
- Colors/pictures showed up like CRAP (capitals indeed) in 256
color mode. In TC it was a lot better.
- the editor for mailer/newsreader had absolutely no functions other
than plain textwriting.
- tho' the stack in itself worked OK, it messed up my modemcommands
everytime I hit "connect" the first time. After that I had to change

them manually and after the next start/connect they turned back into
shit again.
- changing fonts was only possible by editing the config file;
clicking the menu items led to crashes time and again

I know of several people wrestling with it on their Milans and they
cannot even get it connecting. That's at least what I got working over
here when I skip the messed up modemcommands.

Somehow the only people getting it to work (decently?) are Mac users running MagicMac....

Again, maybe all these probs have been fixed in the latest version, but to be honest, I won't believe that until I see it with my own eyes.

You know, some people keep telling us to give them (Oxo) a chance. Well, I'd like to but not for such crap which will only SHOW it's crap after you paid FF 290... And I believe this is going on for a couple of years now :-(

Well, since I'm hearing similar stories from Draconis, I tend to agree with people suggesting to start all over from scratch. It might lead to better results in shorter time and perhaps for less money too...

Just my 5 cents :-)

Let's do remember what I said a few months ago; the problem begins when you buy this program,
after that, do expect to NEVER be satisfied.
3 years ago, for the Wensuite team (only two guys in fact ...) Wensuite was ALREADY ready for use with ftp, mail, news an so on and at this time the authors said without any shame that it was the best program ever made for the atari internet connection, the publicity (in french ST MAG ...) was: Internet on Atari ? So easy with Wensuite it does it all (ftp, mail, news ...)
They simply were lying to illegaly get money from the customers.
Let's have a serious look on what this program is able to do today .... it remembers me another story .... Oasis.
All you can read about this master piece program on the french news group is problems and complaining about problems.
This has not changed since 3 years ago.

> Somehow the only people getting it to work (decently?) are Mac users
> running MagicMac....

I suppose you are joking here ? Who the hell would like to run this program on Mac when you have so much good and well designed alternatives ?
Just try to use it on the real atari ... let's give a try and you'll see what I'm talking about ...

And the icing on the cake: let's give a look at their other programs: XXL spreadsheet and above all EXPRESSO their wysiwyg html editor perhaps at last will you understand why Wensuite is "so much advanced".

When I was using intensively my TT the oxo demo programs were the winners to make my computer crash so much (and I have downloaded so much hoping they had resolved so much simple problems like displaying correctly pictures) ... no other program leaded my TT to crash so often.

Oxo = promises never held.
If only their programs wsere shareware .... but they are "so proud" of it.

> You know, some people keep telling us to give them (Oxo) a chance.

I must admit one thing: when there is no reasonable alternative a lot of people rely to what seems to continue to develop even if it is a joke program.

> Well, I'd like to but not for such crap which will only SHOW it's crap
> after you paid FF 290... And I believe this is going on for a couple
> of years now :-(

Nobody can say today what will happen with Wensuite, but 3 years ago
everyone knew everything about the not very serious Wensuite authors and two
months ago I said the same as today.

Let's hope for WS users it will change one day ....

What do you mean by install script? Does that mean the user has to get a
script elsewhere before he can use it? Does STiNG now come with such a
script?

Just kinda curious if it would support the Falcons higher resolutions
and or color depths.

As far as why bother. I would have to be a bit nutty to spend $1200
bucks to buy hardware to run software which slowly and partially
emulates a computer I already own when I could spend $300 to speed of
the existing Falcon.

Try ST-Ram board from wb-systemtechnik and a realy fast 16MB simm.
I use this board in my machin, but.. wonï¿½t work with ANY CT2 Falcon
well..

Forget FalconWings. Other not tested. Canï¿½t buy them all.

Other way is to change the original ST ram board to another..
Mybee some works fine, but also not all!

Best: CENTRam (Sell my last board two weeks ago)

> The thread is 80 columns. It branch off into how it is easy for
>someone to go beyond 80 because the software is so users friendly.

Well, not really. It branched off into someone suggesting NEWSie shouldn't have word-wrap, because OE users are morons and if they can't post in 80 columns or less, they're not worth reading. I disputed that, and from there it evolved into computer friendliness.

>An Atari is User Friendly and So is a Windows Computer as well as an Amiga
>and Mac.

Agreed.

> IIRC you like to play with hardware.

Not really. I would say I'm probably above average in that department, but I'm certainly no tech and no hardware hacker. I'm not afraid to make a simple hardware installation, but I've never soldered a thing nor cut a trace in any computer. When I wanted an memory upgrade in my 130XE, I paid someone to do it, but I had no problem installing SIMMS in my 1040STe. And installing memory (or anything else, for that matter) in my Compaq is much, much easier than installing SIMMS in my STe was.

>However I can guarrantee to you that installing the hardware listed below
>is far more complicated to the users of Windows based computers than it is
>for them to set their columns to 72.

Agreed. But it was never my point that it was difficult for Windows users to set their columns to 72. Either they're ignorant of netiquette, ignorant of that capability, or because virtually every newsreader in the world (save for NEWSie) has word wrap built-in, they consider it no big deal.

> And perhaps it is now just NEWsie users, since Okami now corrects the
>the posts. But I can assure you that on this NG, I am not the only NEWsie
>user, nor the only Atari User with his ST on the internet.

Agreed, but I believe NEWSie can be used for other newsgroups, too. Wouldn't you want it to handle word wrapping in the tens of thousands of other newsgroups? Or do you think that someone who posts in >80 columns is simply not worth reading?

Personally, with screens becoming larger and larger, I find it silly to hang on to this very old 80 column standard. Even FidoNet allowed virtually unlimited line length, letting the reader's wrapping fit the user's screen, instead of having it predetermined for him. And if hard formatting was

necessary, that was very simple, too.

Hello everybody...

I just installed the Centscreen on my STock Falcon and I am pretty happy with the results. 800*600 in CAB is just that hair more that you need. No complaints so far.

What I was wondering was... Is there anything like this for the TT?

Whether it be 800*600*16 or 640*400*256.

Oh, and for anyone that doesn't know, like I didn't until just recently, this program increases the resolution of a stock falcon.

Later Brian.

Yup, but most of the online shopping sites I've come across use Javascript
or Java applets to run "carts" etc. So CAB still won't do the job as things
stand at the moment.

This could have no effect or it might just solve the problem. Apologies if
you've been round this particular mulberry bush already.

I had similar symptoms with STinG under MagiC PC at one point and almost
gave up, until someone suggested deleting the CACHE.DNS file in STinG's
folder (this forces STinG to make a new one). Lo and behold everything
started to whizz along. Hope your problem turns out to be as simple.

Is it possible to use Iconnect package in TOS (anyversion) without the aid of Magic? Basically to use the PPP Connect, with CAB and the Overlay that comes with the commercial version, even if it is in a limited fashion.

Will this program work with Geneva in a limited fashion?

I am just looking to see if there is any benefit for me going to the commercial version of CAB and its clients, besides the fact that it appears to have the edge over STing and its overlays.

While Commercial Cab is apparently more compatible with certain web pages as far as my limited knowledge goes, it would only work on some of my Ataris.

My Falcon doesn't run my copy of Magic 4.0
My TT had Geneva, Magic 4.0, and Multi Tos installed
My MSTe has Magic 4.0 and TOS 2.05

and although my 520ST has Magic Installed, I actually turn it off if I want to go to a web page with graphics turned on in order to free up more ram. And there isn't enough ram even at 2.5meg to run CAB and NEWsie at the same time so there isn't much benefit over single tasking, as I can bring NEWsie up from within CAB, as well as run a handfull of other clients.

Actually I still think it is impressive to see CAB running, launch NEWsie, then reply to the NGs, which launches the Editor, all while single tasking in a TOS 1.0 machine.

Also does Iconnect require the latest version of Magic?

Later Brian.

3119. Lan Ports

Newsgroup: comp.sys.atari.st
Date: 1999-11-30 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <S6U04.450$vd.611@198.235.216.4>
Source record: 69718

My Falcon, TT and MegaST all have these wonderful Lan Ports. I have set up a midi network before between two computers and played midi maze between alot. However I want to use the lan ports of these 3 computers and maybe even four, together in a network with STing. Or another network that is compatible with STing.

The question is simple.

How do I LAN the three together? Two seems obvious.
I am simply talking about the physical connection. Midi is a ring

1 out/in 2
2 out/in 3
3 out/in 1

Is lan only for two computers.

I also notice that most people who have networked Falcons with TTs have choosen to use serial ports over lan ports? Why might this be?

No need to discuss set up using STing or anything.

Later Brian.

3120. Net BSD/STing/STikII/Iconnect & others

Newsgroup: comp.sys.atari.st
Date: 1999-11-30 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <87U04.451$vd.611@198.235.216.4>
Source record: 69719

Perhaps this is to broad and I should have focused on one thing at a time. I am not looking for flames or a flame war to start out amongst the users of the various programs.

I simply have a question, well a few actually.

I recall when Iconnect first appeared it couldn't get alot of web pages. Now so I am told it has become greatly enhanced and gets web pages that I have been unable to receive with STing/CAB OVL.

I am told that between the two (that I am aware of overlays) for CAB using STing, some other pages become available, depending on who did the last update, Dan or Oliver, and more functions.

Does mintnet need Net BSD or is this another stack? Correct me if I am using the words incorrectly.

I am under the impression that STing/STik are compatible stacks.
Iconnect is another stack
and Mint Net is another stack once again.

Does it matter if a stack is compatible with the M$ way of their server?

For FTP does the stack matter or is it the program using the stack, that allows access. Certain sites I cannot get and I swap between various ftp programs with STing.

So, what I am saying to use an example.

Terry May brought up online banking, and certain limitations using an Atari.

Q Funk stated that Mint Net supports this need.

Is it Mint Nets OVERLAY for Cab or is it the STack?

Therefore is the problem with STing not having the feature for the overlay to take advantage of, or is it simply that it is not yet implemented in the overlay?

Is it Iconnects sockets that allow it to access certain webpages that I cannot or is it the overlay that comes with Iconnet package?

Finally, can Mintnet with Gluestik use these same clients and get superior performance, such as greater access to Webpages and ftp sites or does it simply allow the same limitations of the stik clients.

I have only used STing, so much of my post is guess and speculation.
I know not how things work. Please tell me.

This is a good start,

later Brian.

3121. CAB 2.5 Crashing

Newsgroup: comp.sys.atari.st
Date: 1999-11-30 00:00:00 UTC
From: Lewis <lewisfowlerNOIeSPAM@uswestmail.net.invalid>

Source record: 69720

Heya, you might remember me from a month back, when I was having problems with I-Connect. The good news is I finally got I-Connect to work (it was a problem with my ISP) OK, so I-Connect finishes and it gives me an online timer, but when I try to open up CAB 2.5, within three seconds a white bar appears across the top that says "system destroyed". I again need help. Any ideas where I should start?

thanks, lewis

> Iconnect is another stack
> and Mint Net is another stack once again.

Correct.

> Q Funk stated that Mint Net supports this need.
>
> Is it Mint Nets OVERLAY for Cab or is it the STack?

MiNT-Net's CAB overlay. It needs MiNT-Net as its stack, the same
way the overlay for STiK needs STiK as its stack.

> Therefore is the problem with STing not having the feature for the
> overlay to take advantage of, or is it simply that it is not yet
> implemented in the overlay?

SSL is a browser protocol. It resides in CAB overlay.

> Finally, can Mintnet with Gluestik use these same
> clients and get superior performance, or does it simply allow
> the same limitations of the stik clients.

Slightly faster, but not inherently better, since it still
forwards STiK calls to MiNT-Net.

Are you familiar with the inner workings of Wizards?

Basically, they are programs that follow a script that comes with
the package you just downloaded. Based on the script's content,
they will create the Wizard's dialogs to suit the package you are
about to install and execute them, step by step.

> Does STiNG now come with such a script?

Keyword was "could" so, no.

Can anyone here in Britain help me with this one?

I recently "subscribed" to Freeserve via their online subscription page.

Using the STING scripts supplied with Atari Computing as a base I created my own. I managed to get a connection but it is painfully slow and most web pages time-out before much progress is made.

My default.cfg is pasted below. Is there anything that I can do to improve the performance ?

Thanks,

Peter

I'm confused. I get slammed for saying Ataris can't do online banking, nor shopping at many sites, but from what you say above, it can only do those things in theory. It apparently doesn't yet have the capability. What good does it do the end user if it could do those things if only someone would write the software?

I guess I was right. Or if someone has their Atari doing online banking or shopping at sites like 800.com and buy.com, please do tell. I honestly think that would be great if they can.

(The following comments are not directed at you personally, but are meant for the general audience.)

I'm not trying to put down Ataris or anyone using them, but I am trying to offer a different perspective. Seems so many people are so caught up in the Atari religion that they wear blinders when it comes to any discussion comparing Ataris with other platforms. I was the same way for many years, so I speak from experience.

It's great if your Atari does everything you want it to. But don't confuse that with thinking it's God's gift to computers and can do everything any other computer can, and if it can't something, it's not worth doing anyway. Also, don't confuse owning a computer with belonging to a cult or a religion. Geez, you never see people so emotionally attached to any other appliance or tool.

No, no, no... I wouldn't shoot you like that, Brian. Lethal injection would be more civilized, perhaps using the tainted blood of Bill Gates to fill the syringe. Your body would immediately produce an exception error and shut down, with the only chance of survival being the antiserum from a Tramiel <g>.

All kidding aside, M$ really has nothing to do with the issues here. And I'll give you more to scream about: good netiquette dictates that you quote first then respond underneath.

> well everyone else seems to have wordwrap:-).

I'm not so certain all the other newsreaders out there have wordwrap, or if they do it's not automatic (the user must rewrap as an extra step). I'm speaking of quoted text, not text without linefeeds like the ASH mailer was known to produce (or whatever caused those very long lines).

Speaking of standards, NEWSie shouldn't truncate message IDs like it did with your followup here. That's not your fault, though; and propagating quoted text over 80 columns really isn't either. Both can be blamed on your newsreader, and both can be fixed in your external editor. But this manual work, especially the message IDs, is asking too much of the user.

> Actually, I have been using ed hack lately as an editor.
> Before that Tempest II.
> And I have just gotten the lastest qEdit and am using it with CAB.

qed has very good macro capabilities. For quoted text it's a matter of searching and replacing the quote characters, rewrapping the lines, then putting back the original quote characters (I had set up two macros to do this).

Rebuilding truncated message IDs is a little more difficult, since you have to search through NEWSie's offline path to find the original article so that its complete message ID can be pasted into the references of the followup. But, as mentioned, this is asking too much of the user.

Emm, Some people like to have a Gem Installer but I certainly not. Using a
Installer can lead to some serious troubles like for instance losing of
important configuration files because the installer override the old
configuration file.
I do like to install the stuff myself. This way I know where to search if
a problem occurs.

I don't know if there is a limit. It depends on the window width and used
font.
For instance on my system with Monaco 10p. font Kobold diplays of files
like this w3c-libwww-apps-5.2.8-1.m68kmint.rpm (36 chars) only 31 chars
w3c-libwww-apps-5.2.8-1.m68km..
However if I use Rufus T-mail ANSI 10 p. font Kobold displays all the
chars.

Hmm, nobody has said that their products are crap. I do use some products.
The truth is that some program are indeed less functional without Magic
whilst others even doesn't work at all. And that is what I dislike. There
is no reason whatsoever that make ASH mailer for instance MagiC only.
I can accept that there will be some things working differently when used
under another system but NOT that the prog refuse to work at all.

The same goes for Wdialog (has nothing to do with MagiC) I can't accept
that some programs refuse to start when wdialog is not available. A good
example is Olympus (driver for digital camera's). Olympus won't start at
all without wdialog. Why on heavens sake? For the print option? But I
don't want to print at all. For the font handling? But I don't want to use
another font. Is there any good reason why it needs wdialog?

Where do you get the original TOS? I'm not sure what you mean by "drives in container files". I know that you can buy the chips installed in an ISA card, is that what you are referring to?

Unless there's been an update, no. PPP-Connect needs to be running in the background, and that can't be done in singleTOS.

> I am just looking to see if there is any benefit for me going to the >commercial version of CAB and its clients, besides the fact that it appears >to have the edge over STing and its overlays.

The benefit is that you get an unrestricted version of CAB 2.7 (though the demo is not restricted too much). And you can still use STiNG with it.

> While Commercial Cab is apparently more compatible with certain web >pages as far as my limited knowledge goes, it would only work on some of >my Ataris.

Yes, you can use many sites that STiNG won't allow you to. And the reverse is also true. It's great to have the choice. I found myself using PPP-Connect most of the time, though.

> My Falcon doesn't run my copy of Magic 4.0

I suggest you get 5.11 or greater. Works great on a Falcon (at least it did for me), and is much, much better than TOS. Of course, it also helps if you have 14 megs of memory in your Falcon.

> Also does Iconnect require the latest version of Magic?

No.

yes it does now by reading a Tos image file that you can extract from your
Atari with a small program
also check out Tos box there are a few links on my site

My son has this Atari and tells me that he would like a monitor for it as his Christmas present.

Since it's a present I have to find it - as well as paying for it. Good old Dad!

Tips about how to find such would be helpful.

Should I be posting to another | different newsgroup?

Didn't Atari make these in a 286 and a 386 version?

Also, I'm interested in the DOS that came on these machines.
What version of DOS came with them, and was it a standard DOS or
a Special Version?
Did any other software come with these machines?
If so what software was included?

> is that what you are referring to?

with the docs of the demo being in German this took me a while to find
out,basically what you do is extract a tos image from a real Atari up to
2.06,call it magic_PC.os and put it in place of the real one that
came with the demo ,on the demo drive C is a "container " which is a virtual
drive it will act like a real C drive but the only way to get stuff into it
is via A floppy,the full version lets you map drives to PC drives and create
containers in Magic P.C. mode,but in Tos mode it's all containers,drive O
however that doesn't need setting up as a drive or container will let you
access and copy to and from the real PC drives,there is a tiny program on my
site to extract the Tos from your Atari and I think there is also one in one
of the MagicPC folders on the demo,I believe there are some Tos image files
on a site but haven't got the URL, when I do I will place a link on my site

Isn't there an RFC that specifies that messages should not exceed 76 (or
78?) columns? I certainly find a problem with the ASH Emailer messages in
CixRead: They do wrap, but lose one character at the end and leave an
untidy, ragged appearance that is hard to read.

>The world's not going to slow down just because you still want to use decade
>old hardware. I love my Ataris, and I know I _can_ get them on the 'net, but

Fine, but not all of us have that alternative! And if there are
standards, software should adhere to them.

I cannot see why people are complaining about ASH. On one hand they say
they are the Microsoft of the Atari world, secondly that their products
are less functional without MagiC, but then MOST go and say that their
products are CRAP!!

I've been trying for an age to go figure on this one. Its like people
who think their products are crappy are complaining that they get less
functions without MagiC. If they believe the products are crappy why
are they wanting them anyway?

I challenge ANYONE to go figure...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Galen,

The only Sting cpx I am using is the Sting Internals. I have the CAB Overlay configuration Share_Time set at 20 on my TT. Once I was running a program in the background that was taking quite a bit of timeslices from the CPU. I didn't realize it until I removed the program and Cab started to download faster. The only program I use in the background now that takes CPU time with Geneva is Menuinfo 2.49; I changed the refresh rate to 500 ms from the original 200 ms and could tell a difference in Cab download rates. I also have the background operation speed set to fast on my TT; I could also tell a difference in CAB's download speeds from the original medium speed.

Maybe one of these might help you.

Yea, about two years ago Derrik and Steve said that Gemumucker would
run TOS 4.04.... Why?????? Your surely not going to run Falcon demos
or games under it.
I think the only reason that it is even a bit popular in this NG is
that most versions of it are free. It's a dead subject.
MagiC Mac blows it away anyway. If you want to emulate the 68K, get a
Mac and enjoy the graphics.

Hi,

Could someone recommend some good Falcon/ST sites with
software/shareware?

How about games from companies, etc, hobbyists.?

Just looking for some hardcore Falcon content and files.
I've been to atari.org and some others, but many links are broken.
)Extremely many links!(

Does anyone know anything about this WHIP! program for Falcon?
I've heard its' supposed to be like the VLM for Jaguar, if so, where
can I find it?
(very interested!)

and at last, does anyone have any older mags relating to the Falcon?
Anyone have any Scan's or pics of the falcon , hardware, games, misc,
and so forth!?

If you have anything nice to share, please feel free to email me at:
xNexar_Net_x@yahoo.com
or
nexar@atarist.com

Thanks,

Clint T.

Well mr. Wilkonson, did I say they are crappy? Sure, there's a lot of
things I don't like about much of the software ASH distributes but there's
not much ASH can do about that since ASH doesn't make any software
themselves. But the fact is that some of their software, like CAB, is
advertised and sold as TOS-compatible, although they need MagiC for much
of its functionality. Yet it's more expensive to buy if you don't have
MagiC and can't use the software to it's full potensial. Why shouldn't I
complain??

Unfortunately MSIE4 is the most popular browser (according to
statmarket).

> Perhaps it's fixed in 5?

It's working to some degree (alpha support is buggy among other
things). But that's only the Windows version - the Mac and Unix
machines are a total different story.

I bought one of these machines about 5 years ago for the same reason -
curiosity mainly because it was made by Atari. The keyboard which came with
it looked like a normal PC one but when I tried the Atari keyboard on a PC
it did not work. The Atari which I acquired had a mono screen and an
internal 5.25 floppy. It booted up using a normal PC Dos floppy and it was
able to run a few very simple (by today's standards!) games.
Hope this helps. Incidentally I don't have the Atari now.

Source record: 69790

Downloaded it last night. Works a dream on my MegaST4, Falcon and Milan at least in Local browse mode. Very much faster than CAB, much more integrated (FTP, NEWS etc all in one package) and help files (and these are small extracts from what looks like a very good manual) are superb and put ASH to shame. Will probably register. Thanks to Nicholas Bales for the translation, very, very good.

One small point, seems to interpret some HTML commands not so well as CAB, eg tables don't look so 3D. but this should be a matter of tuning, and if OXO don't get some response from this side of the channel, why the hell should they bother with us. Previous posters have been very down on OXO. Well, they have come through, so as I have said before, give them a chance.

Why is that unfortunate? It's the best browser available, and I wouldn't choose Netscape over MSIE if I had a PC or Mac. I might have used Opera if I had a slow PC, but MSIE is definitely my first choice.

Bob,

just don't wanna be rude, but first wait till you get it working
decent ON line.... I've been testing 3.12 and 3.20 with a key here and
I found it unstable, not displaying stuff right and using the
mail/usenet stuff was a pain in the neck. I sure hope that's ALL gone
in 3.30 :-)
BTW: I tested under TOS and MagiC on my TT. The stack was the best
part.

Hi,

two month ago I got ct2 installed in my Falcon. Since my old 16 MB
ST Ram card was too slow in turbo mode I tried to get another one.
Centek doesn't sell theirs anymore, VANTAGE 2000 is not sold anymore
and SystemsForTomorrow now sells only GIZMO, which was said to be as
bad as the one I already have.

So can anybody tell me what ST Ram card I can use that's still
available and where to buy it ?

Thanks in advance !

I am new to Atari's but have become interested in them due to a friends large collection of them and the things he is teaching me about them and their capibilities. I am almost through the process to becoming a Microsoft Certified Systems Engineer and I am really getting into the general computer theory and especially how M$ does things vs. the rest of the world. I can't believe that Atari has floundered considering how far advanced they must have been at many times.
Now as far as M$ products and the registry goes you just have to be ready to re-install at regular intervals. The best I can describe it is M$ creates an OS with LEGO's. You build something. Ooops it's buggy. Instead of rebuilding it we add a few more pieces to fix that. Oops that causes it's own problems. Add a few more pieces. And so on. The registry is the VooDoo curse. Most people only see it as evil. Mess with it and it will curse you. Try to fix it and it will make you go insane. Back-up and re install. Now that's the way to make a M$ system bullet proof.

This assumes you already had software to handle your CD-R and scanner. A
stock Atari would not be so simple. You wouldn't have to worry about that
on a Windows machine. Either Windows would already have the driver or it
would come with the hardware or both.

As CAB 1.5 is a bit unefficient, I am still looking for a web browser to be
used with Atari NOS.

Is wensuite "open" ? That is, may I make the wensuite browser to cooperate
with NOS tcp/ip ? It is working really good with CAB now, but there is no
future for this browser....

What is the registration cost for wensuite and what are the limitetions for
an unregistered version ?

Sorry to ask you, but I never get the time to connect myself 8^)

Yes, you're right. Kobold switch to GEMDOS mode if the source and/or
destination partition is a VFAT, minix or ext2 one.
It's IMHO still faster then the desktop copying function.

Yes the same problem - although paid by cheque, which I mentioned in a
previous thread and Denesh replied saying to email him again - which I have
twice with no reply so I guess his Internet Service company must take up all
his time. Having said that I would have thought he would have at least
tried to respond even out of courtesy just to say what's happened or that
he has finally closed CyberSTrider altogether so people can try another
route to registering.

Mike,

Wensuite is not exactly open, it's using its own TCP/IP stack. It has
a usenet client and an email client, these work, but the FTP client
wasn't implemented in previous versions.

The browser works only offline in demo mode. I'm really not sure about
the other stuff but I figure you only get it online in registered
version.

AFAIK, registering is 290 french francs. Read my previous posting
about the stuff I discovered with 3.12 and 3.20...

news:38442e79$0$7551@znews.zetnet.co.uk...
> Are any vector images formats in use on the web ?

There are moves afoot to try to get a standard going, but I don't know the details. I believe there is a plug-in available for the big two browsers allowing in-line Corel Draw pictures, but I might have the wrong end of the stick here.

Problem with vector graphics is that they seem to get mangled very easily when passed around between programs, at least in my experience. Even between programs which ostensibly support the same file format. Even if they display OK, things tend to go pear-shaped when you edit objects. Things get even worse when converting files between formats, let alone platforms. Ever tried swapping files around between Hyperdraw, EasyDraw, Kandinsky and Arabesque? Not to mention converting between GEM and CVG.

Things are just as bad on PCs even though everything is supposed to understand WMFs as they are used for the clipboard. I suspect things are as bad on Macs too (when is an EPS not an EPS etc).

Also the minute you include text things get even worse due to font differences :-(

> If not perhaps GEM-image support could be added to browsers ?

Reality check time: it's much more likely to be either a completely new format or one of the most popular ones (read: PC, probably either Corel or WMF).

Apparently, though I have yet to get CAB 2.7 to do anything with
Iconnect. Probably me rather than Iconnect at fault.

> I am told that between the two (that I am aware of overlays) for
CAB
> using STing, some other pages become available, depending on who did
the
> last update, Dan or Oliver, and more functions.

Apparently so. Seems to be connected with cookie support.

> Does mintnet need Net BSD or is this another stack? Correct me if
I am
> using the words incorrectly.

MiNTnet is a TCP/IP stack for MiNT, which provides BSD-type sockets so
it's easy to port Unix net software to MiNT. NetBSD is a freeware Unix
OS, an alternative to Linux, and a clone (ish) of BSD Unix, as is
FreeBSD for that matter.

> I am under the impression that STing/STik are compatible stacks.

Yup, though STinG has extensions which STiK doesn't. So while just about
all STiK apps work with STinG, not all STinG apps work with STiK,
particularly servers.

> Iconnect is another stack
> and Mint Net is another stack once again.

Yup.

> Does it matter if a stack is compatible with the M$ way of their
> server?

I'm not totally sure what you're asking here, but you might find this
easier to get a handle on if you think in terms of layers.

At the bottom you have TCP/IP which defines how data packets are
physically routed and verified.

Next layer up is the layer which defines how a particular connection works between the two ends. This includes HTTP for web connections, FTP for FTP connections and telnet for telnet connections.

Next layer up are the programs themselves at each end. Server software at the server end, client software at the client end.

All this is slightly to one side of the physical side of things, eg *physical* servers (ie the machines) and the OS they are running. So the answer to your question rather depends on whether you mean M$ server *software* or whether you are referring to the hardware/OS combination. It's perfectly possible to use an NT server (machine/OS) running non-M$ server software eg Apache.

> For FTP does the stack matter or is it the program using the stack,
> that allows access. Certain sites I cannot get and I swap between various
> ftp programs with STing.

These tend to be problems with the FTP clients rather than STinG per se.

> Terry May brought up online banking, and certain limitations using an
> Atari.
>
> Q Funk stated that Mint Net supports this need.
>
> Is it Mint Nets OVERLAY for Cab or is it the STack?

It's the overlay. The MiNTnet one has SSL support. If the STinG ones did you'd get the same effect.

> Therefore is the problem with STing not having the feature for the
> overlay to take advantage of, or is it simply that it is not yet
> implemented in the overlay?

The latter. Olivier Booklage is working on SSL for his STinG overlay, by all accounts.

> Is it Iconnects sockets that allow it to access certain webpages that
> I cannot or is it the overlay that comes with Iconnet package?

The overlay.

> Finally, can Mintnet with Gluestik use these same clients and get
> superior performance, such as greater access to Webpages and ftp sites or
> does it simply allow the same limitations of the stik clients.

It will just be like using STiK, effectively. All Gluestik does is emulate STiK's programming interface while passing the TCP/IP packets via MiNTnet. Functionality should be identical with STiK/STinG in terms

of what the clients will do. Though you could run all the STiK things at the same time as running CAB with the MiNTnet overlay, which might be an enhancement for you if you need SSL. You might get improved functionality by using MiNTnet-native apps instead of STiK ones (which is what you effectively do when using the MiNTnet OVL instead of the STiK one).

> I have only used STing, so much of my post is guess and speculation.
> I know not how things work. Please tell me.

Hope this is helpful,
John

> ROM "image"?

The English version is behind the current German one, but it's available
from System Solutions in the UK. Not sure about US distribution. BTW the
demo is severely restricted.

UK price is about UKP100-ish, price varies depending on bundle. I'd
advise getting it with NVDI-PC or NVDI5 as this will give you enhanced
resolutions and much faster screen redraws.

It's a kind of hybrid emulator in that it emulates a sort of ST with
expanded memory and a graphics card. Later versions have increased
capabilities and speed: I can only vouch for v1.2 which is the latest
English version. This lets you have up to 14Mb RAM (emulated) and runs
quite nicely at 1024*768*16 million colours. It comes with MagiC
(obviously) rather than needing TOS - v.1.2=MagiC 5.11, later versions
have harmonised the numbering between Atari, PC and Mac versions of
MagiC.

You can however use a TOS image with it instead for compatibility with
picky old programs. It comes with a program for extracting an image from
a real Atari. In this mode you are limited to standard ST resolutions
and can only use drive containers rather than accessing Windows drives
directly: there is a way of reading from Windows drives but not writing.

In normal mode you can have a mixture of containers and mapped Windows
drives/folders. Compatibility is OK for the most part with modern
software that runs under Atari MagiC as long as it doesn't rely on
hardware which isn't emulated or try to access hardware directly.
However I have had problems with graphics packages when using more than
256 colours and have yet to find a paint package that works acceptably
under it. But then I haven't done any systematic testing of all
available packages.

machine.

Depends on the hardware, but much Atari stuff just plugs into either the SCSI bus or cartridge port and you install some software to drive it. Except you are in control, not the machine. What's different on the PC except having to delve into the case, IRQ conflicts, blasted Wizards everywhere etc etc?

[Windows hiding what's going on]
> But I've already stated that the Atari is a much simpler machine,
because it
> does a whole lot less.

Only because software and hardware support has all but ground to a halt. If you mean Ataris come with less built-in software then I agree, obviously. However, there is nothing fundamental about Atari systems which precludes them from being as versatile as PCs.

> With complexity comes confusion. I don't see any
> way around that.

Complexity *doesn't* equal confusion with good design. The Atari way of doing things promotes simplicity in terms of system organisation, but doesn't preclude complex setups. The difference is that the complex setups can still be quite obvious in terms of working out what does what. Windows frequently seems to be deliberately obscure (have you never spent hours trying to find the right "friendly" dialog box in which to change a basic setting?). No wonder it has to subject users to Wizards for everything...

This is, unfortunately, quite true. It would be nice if hardware
manufacturers included Atari software, but such is not the case :-(

I really enjoy my Ataris, and I think that Atari had an incredible
power/price ratio for a while. When I bought my first computer in 1990
there was no real question which I preferred (For the record, I had NO
prior Atari experience prior to 1990, unless you count the VCS. I
really made what I thought was an informed decision about the 3 systems
available in my area Mac, IBM, and Atari). Of course, I also own a
Saturn automobile, so perhaps I just don't like being too "typical". :-)

> few more pieces. And so on.
This is largely because of the size of the project. Most great
software was masterminded by a single individual and programmed by a
very small team (generally less than a dozen people). Very large
programs are also written by teams, but each team builds a part of the
program and often doesn't even know who the other people are. It's
very difficult to keep continuity in this environment.

I suspect we aren't going to convince each other on this. I've had a
pretty easy time with both (usually).

> But I've already stated that the Atari is a much simpler machine,
> because it does a whole lot less. With complexity comes confusion.
I'm not convinced Windows machines are that much more complex. The
software they run is certainly more complex, but complexity only
implies confusion if you are unable to follow the complexity. Modern
mathematics is a field of considerably more complexity than a computer,
but it is understood quite well. (Of course, we've had a few
centuries).

Getting back to the point, the Atari's disadvantage is primarily
horsepower (or CPUpower, if you prefer). 99% of the time, anything you
can do, I can do -- slower of course, but I can do it. Consequently,
the only real advantage of modern equipment is with time sensitive
items like Java (could do it, but so slowly why bother?), gaming (could
generate those 46,957 polygons, but refresh speed would be 4-5
frames...per hour). I think the issue is really capability, not
ability.

Since it is free in the basic version, there really isn't any reason
not to get it. I only use it for one program, but I'm glad it's there.

> Budget computing, isn't that why we're all here?
No actually. I use my Ataris like people use Model T Fords. It's a
love affair with a bit of my past.

This is, unfortunately, a pretty well kept secret. I once asked Bob Brodie (when he was in Sacramento, CA) if Atari had sold a million ST computers yet (this was in 1993). His answer was: "Oh, far more than that!" If anyone has better data, I'd love to hear it too, but I suspect it'll be very difficult to dig up.

Sorry to bring another equation in here, but ASH are bundling IFusion with their ftp program fiffi (V1.12). This utility lives in your Auto folder and allows one to use any STinG/STiK (the two are to all intents and purposes the same) client with a connection made using IConnect. That means that you can use ASH's Emailer alongside aFTP, should you so wish.

Well, it's not so much the software that bothers me here. Some wizzbang
programmer that left the TOS scene years ago makes a statement that they
will be able to run TOS 4.04 under their emulation product a couple of
years ago. That starts all this crap about running "Falcon Only"
software on a PC, and that "ain't" going to happen. I think we are all
stuck with our lovely birds, and I don't mind a bit! Just don't ask me
where to find TOS 4.04 ROM images :). Gemulator, MagiC Mac and the other
applications are great for when your hardup for a TOS fix, but there is
nothing like the real thing. Sorry, I just have this mad, passionate
relationship with my birds.....

Has anyone been able to get registered share ware from Denesh? I am asking because I ordered some software over a month ago, requesting e-mail transfer, paid for the order via credit card and, as yet, received nothing. My e-mail to Denesh regarding this situtation two weeks ago has not been answered.

While the amount of money involved is not much, it is more the principle of the matter. By contrast I can order modules, upgrades via the "net" from Ulf (Calamus) and will get the disks via mail within 7 to 10 days. The same is true for Systems For Tommorow.

No. Iconnect will not work with Geneva. I can get it to log on and get a
PPP link, but then the program freezes and the computer completely locks up; I
have to press the reset button.

Try telling that to Microsoft:

* Excessive line lenghts
* regionalized Re strings (e.g. Sv, Vs, ...)
* non-standard character-set (a strange variant of ISO-8859-1)

All the above (I probably forgot some) breaks one or several RFC,
but the world keeps on turning.

Still, an idea:

Those California dudes sueing M$ might wanna consider adding
"breaks recognized standards" to their claim against Redmond.

It just seems like the marketing of a 56k modem (for the net) is a scam! Especially when (useing Trace Route) there may be ten DNS#'s getting to the final connection! With a BBS connection, there's your modem, their modem and the line in between. A lot less interference!
John P.S. I have a 56k on the way anyway!!!

The programs mostly run fine in the 32 mb FastRam I got with ct2.
But ST Ram is needed for screen memory. So at the moment in Turbo
mode I have quite some flickering on the screen.

It's also my first choice (on a PC) but I don't like one browser
dominating the whole browser market. I also didn't like it when
Netscape dominated the WWW.
IMO, a domination leads to a lack of respect for standards (set by the
W3C in this case).

Hello

How many ATARI Computers were sold during ATARIs lifetime?

It is interesting for me, how much STs (MegaSTs, 1040ST, 520ST), Mega STEs, TTs, Falcons, ST-Books, Stacys were sold in the different parts of the world (Europe, USA, Kanada, Australia and so on).
Additional it is intresting, how much 400, 800, 600XL, 800XL and so on were sold.

If anybody knows something, please answer in the board or directly to me: gerald@gerald-koerner.de

Thanx

Greetings

Gerald

Ohh, no, they are big bucks, but support 32/64k and 16m color, a
question that always arises when Gemulator is brought up. The way I
understood what Derrik M.(sp) had said at a show was TOS 1.xx to 2.06 do
not support anything beyond 16 color, and neither do his products. TOS
3.06, correct me if I am wrong, still only support 16 color at 640*480.
While TOS 4.04 is used on a system with 32/64k color available, that has
to do with the VIDEL in the Falcon. Just because TOS 2.07(Sparrow
TOS)-4.04 is running under emulation doesn't mean that the VIDEL will be
available for Falcon specific applications. I just don't see any
advantage of running TOS 4.04 under Gemulator, it's marketing hype. It
really doesn't do anything more than TOS 2.06 does. Most users install
Thing, Boxkite and other system enhancements anyway. Maybe it will
benefit some sort of musical interest, I don't know much about that.
If you're into the older games, Word Processing, or just in general "ST"
only software, Gemulator is a nice product. If you want to do serious
DTP or graphics with TOS applications, then MagiC Mac is the far better
option of the two, if only for the simple fact you see your work instead
of a dithered image, IMHO.
As far as the big dollars go, I choose to stay with the Atari platform a
long time ago and have accumulated some very nice software and hardware.
I choose not to keep upgrading a PC every other year, and the Macs are
surplus machines. I purchased MagiC Mac from Toad back in the day, and
recently purchased the latest version direct from ASH. $150.00 for the
Macs, and $200.00 for MagiC isn't a much of an outlay considering that
is less than most FX cards cost for a PC, plus the cost of Gemulator
itself. GEM applications (actually MagiC Mac isn't an emulator, it is an
operating system for the Mac that runs GEM compatible applications)

under MagiC on a Mac are much faster anyway. There isn't much of a comparison between the two.
Budget computing, isn't that why we're all here?

> relationship with my birds.....

I know how you feel - these days I mostly use my Quadra 950 for most of
my important work, but missed the Falcon so much I just had to resurrect
it in my setup. The two systems are now on and under my desk, and now
share a common SVGA monitor via a switchbox - I call it "The Beast With
Two Brains" :)

The Quadra is used for most Internet stuff and fun hi-res gaming (I've
discovered Ambrosia Software games, how marvelous!), while the Falcon is
set up for word processing (I love Edith, the closest I've come to that on
the Mac is BB Edit Lite), MIDI (I've got songs I've written and Logic, so
why waste a good thing), Calamus SL (ditto) and as a backup Internet
machine should the Mac go down (which it has, a few times, since getting
it in July).

and pretty soon I'm going to hook up the Falcon to the Epson
PhotoStylus I got for the Mac and see just what it'll do.

actually, I just thought of something - maybe my next step should be if
I can hook up the two with a common keyboard and mouse! (I read somewhere
that someone's done a switch box for hooking up a PC keyboard and mouse so
they can be shared between a Mac and a PC, maybe if I got that and then
got one of Mario's QWERTYX from Ken :)

I have one of those at work I am going to bring home for testing :)
As it is 720DPI, we as least have drivers for it, don't know how the
extra colors work however. It CANT be any worse than Windows software.

I had my old PC and Falcon connected this way, the Atari didn't mind
the mouse switch, but the PC would usually hang. Maybe some kind of
buffer is needed. I have a Q950 and 840AV. If I really need
comapatibility, they get fired up, but I found myself running MagiC
Mac only, and the Falcon is much more up to the task, alas they sit
collecting dust most of the time.

These connectors are readily scavengable from Apple II unidisks and some
old mac motherboards.

Very good point Neil. I think the original point was to eliminate the overly obnoixious posts that were far from the standard. But your point on the quoting stands as well as many other points about quoting. It is up to the person doing the quoting to avoid including material that isn't relevant (edit it people) and to make sure we don't over exceed the 80 column standard by quoting. This can be a pain I know but it is common courtesy. Nothing more or less.

Hi Denesh,

Thanks for the explanation. I think everyone who has successfully used both CyberSTrider and also Joe's InterActive scheme would attest to how much easier it was to register software with both companies rather than trying to contact authors some of which wouldn't even reply and so would like to thank everyone connected for that. I, like a lot of other users don't use MiNT so online ordering is as yet unavailable to us but hopefully this might change.
As mentioned before I sent my order months ago so basically I wanted to know if you had received it ok and as I found it impossible to contact you at all was concerned that you had not or that my emailer had packed up!

Good point, as the documentation does list around 20 common problems and their solutions. My problem, unfortunately, does not appear to be among those 20.

pc keybrd have been available for atari for quite a while, and now even
better/easier with Qwertyx From Mario Becroft (how do you like this
plugin? ;)) so yes, you can use a 3 button logitech Gold platinum model
and a 108k deluxe keybrd even with the "Internet" ready. (And I bet they
are Y2K compliants!, now you can be happy and safe).

> available to me about what to put on that CD.
yes, quantity is good, but all comes down to the same thing and all PC
users use the same basic software to run simple everyday task.
I get all exited when I see winzip installed correctly on a pc!

Source record: 69502

The previous post is the truth as I know it, too. MIDI is a serial connection, just like the modem port. MIDI data sends stuff like what key is pressed, how hard it is pressed, and what sample goes with what key. I've never used MIDI with the Falcon (if you find some simple, easy to use software, let me know), but I've often played something into my STe at 1/2 speed, cleaned it up, and used the MIDI file in place of an accompianist.

Anyhow, the computer serves to control the other MIDI instruments and to record/play the MIDI files. The instruments make those vibrations we call music.

The pages are slowly going up at www.1632systems.co.uk, we now have Jaguar and Lynx FAQ pages which will be updated, plus helpfiles.

In addition if you follow the links to the Atari Catalogue you will find a new area in the Lynx Games section called Unboxed Lynx Games with prices from 3.99 (UK pounds). Stocks are limited, so first come first served. The address for those who wish to jump striaght away is http://catalog.zen.co.uk/actinic/1632Systems/16_32_Catalogue_Unboxed_Lynx_Games_18.html

The second hand used lists should be going up this weekend, networks allowing.

Please keep me informed of any comments as they are appreciated.

The AlberTT gfx card does 1024x768 or 800x600 in 16 colors or
monochrome and that is it, far as I know. My NEC 3D didn't like
the sync rate on the card so I'm not sure what the sync rate was even.

Source record: 69505

Hello all,

Well, I couldn't get Captive to work on PaCifiST, but that's sortof ok... I got the PC version instead... but I'm stuck ! On the third base (#2, since the first one is #0), as soon as you enter, you are in a small corridor with a metal door, and no button anywhere that I can see. I've tried beating the door down, but that didn't work either. I remember having been stuck there too when I originally played it many years ago, but can't remember how to open the door. Does anyone know ? I've looked on the net, but there aren't any walkthrough for Captive (I guess it's a bit old, so no one cares anymore)

Thanks,

Patrick

>Mac only, and the Falcon is much more up to the task, alas they sit
>collecting dust most of the time.

Using two cheapish manual switch boxes, I share my monitor, keyboard (AT Keys installed in Falcon) and printer between my Falcon and my Wintel box. I don't hot switch though because I'm sure I'll blow one or the other, so I always power everything off before switching.

I'm considering getting another switch box for the 56K modem so that both machines can use it, though with the cheapness of internal PC modems now it's probably just as cheap to go for that option (and avoid yet more cables!).

Mouse-wise I have two rodents, a Darth Vader one for the Wintel and a far more comfortable usual design one for the Falcon.

And which computer is the most reliable and looks the best?

Of course the Falcon running MagiC!

The only two things better about the PC is that web browsing is easier, though IE is shite as far as customising and useful options go, and that my scanner works much better and quicker than with the Falcon.

Just about everything else I have tried is done better and definitely more cleanly on the Falcon!

Best wishes, Mike

My AlberTT card works with my 17" CTX VL700
I don't know the scan rate of the card but
the 700 has a vertical scan of 50-160mhz
and horizontal of 30-70mhz. The card does
not work with two other, older VGA monitors
I have.

Hi group,

I just got an Atari Mega4 St computer. It has no cable for the monitor. I have an old NEC 3D multisync that I want to use. I need the cable, and understand Talon Omniswitch works. Do YOU have one?? My NEC has the 15 pin male connector. Willing to pay fair market value.

Also, which hard drive works well with the Mega4?? I was told that a SCSI drive can be hooked to it.

THANKS for any information !!!!!!!!!!!!

Michael

But the PC is moving *away* from lots of ports and opening the box up to
install everything. Intel in particular is proposing a move towards
iMac-style PCs, where it's either built-in or you connect it via USB or
firewire. SCSI was the first move in this direction (ie just have the
one way to connect things). This is really the only sane way to have
plug-and-play for peripherals. The average punter doesn't want to have
to delve inside the box when s/he can just plug something in and go.

And I repeat, there is nothing fundamental about Atari systems which
precludes USB and Firewire support and vast amounts of memory, were the
hardware still being developed. Original Ataris didn't support IDE HDs
but this was built in later. The limiting factor is lack of development.

The more cynical amongst us would probably say "because of the
Tramiels", but I suspect it has a lot more to do with how M$ managed to
con the business world (including IBM which gave them the foot in the
door) into using its stuff. Atari had a name in games which didn't add
to their credibility, though the German branch really managed to get the
marketing right.

> Now as far as M$ products and the registry goes you just have to

Even the engineer who has been (repeatedly) to fix my PC said the same
thing. Which makes M$'s latest idea (no longer supplying installation
disks for Windows with new PCs) even funnier, except for the poor sods
that buy them.

I find it ironic that business types prattle on about the cost of ownership WRT PCs yet using just about anything else would have been cheaper from the start. PCs are hopelessly unreliable. Examples:

My PC is 18 months old. It's now on its third hard drive, second motherboard, second case, second monitor. Oh, and second OS as I ended up moving to Win98, which so far seems a little more reliable than 95 but now the machine seems short of RAM... This wasn't from some cheap backstreet dealer, but from Evesham Micros, who won an award last year for best PC manufacturer from one magazine in the UK. Cue hollow laughter.

My PC at work (similar vintage) is now on hard drive number 2.

Our computer guys at work reckon we get at least 25% of new machines dead on arrival. And that's an improvement on our previous suppliers :-(

Meanwhile my STe, bought in 1991 (memory upgrade to 4MB and hard drive 93) with a mono monitor, has not broken down yet. The worst HD corruption I've had was on one partition (undeletable folder in CAB cache while running early version), which just had to be zeroed once I'd backed up the data. I have never yet had to reinstall anything on it, I have never yet partitioned the HD (it came set up and I've just left it that way; why fix it if it ain't broke?). It even survived installing the TAF MiNT distribution complete with Minixing one partition with nary a hitch.

I may be lucky, but even though I use the PC a lot these days there is no doubt which machine is better designed and more reliable.

Terry

I have been in and out of this group for well over two years ago, and I do recall you being on the otherside of this arguement in the past. Every computer and every system has it's own merits. Like you I have recently made the switch to a PC, but my choice was made because I had to for business reasons. I still prefer using my STe over either the PC or the Falcon. It has a much snappier feel to it, programs launch quicker, widows display faster, and I get more of a feeling that I am in control of the machine. Is one better than the other; that all depends upon what the user gets out of it.

Think about this. Since 1990 microsofts stock has risen 8000%. In 1990 a used st with monitor could be had for under $400 bucks. A new PC was $2000. The person who bought the st and invested the other $1600 in the Microsoft stock would have $128,000 for a new computer today. The person who sold their atari stock to buy a new PC has an obsolete entirely useless machine and has $1600 less in capital losses to write off offsetting capital gains. Who benefited the most, the person who still has and uses their ST 10 years later wth $128,000 in the bank, or the person who used his PC for 5 years only to find out he had to buy a new computer to find any software to run the latest OS.

What the hell are you talking about.

Do you remember these names Atari, commodore, zilog, digital research, wordperfect, the list could go on for ages; they all had one thing in common, they enjoyed a few years with a total stranglehold on their market and now for all intensive purposes they are dead companies. If you don't think that the same will happen to microsoft you are sadly mistaken. In business, someone smarter, better or craftier will always come along and knock you off of your throne. Gates knows it is coming which is why he has dumped half his holding in Microsoft over the past two years as well as balmer and Allen. Go look at fed filings and see for yourself. Have you noticed that Microsoft has been investiong heavily in other companies, and their free cash is dwindling. This is called hiding liquidity in the event that severe penalties are handed out from the DOJ because they cannot fine a corporation into bankruptcy and no free cash means smaller fines.

You're right, but I see the market supporting both methods in the
foreseeable future. A lot of people will still want to do it the old way,
because it will be cheaper and they won't have all their hardware lying
around instead of contained in one case. I think it just depends on your
level of experience, mostly. I would personally hate the new style.

Yes, if I-Connect was written as an ACC (as STiNG's dialer was), there would be no problem. But it's not, so you have to have a multitasking OS.

When it comes to ASH Emailer I'll have to say it's true... OK, it's not
that bad, but it's much too expensive compared to what you get.

> Is the software worth using though, even under MagiC? Are there better
> equivalents that work under any OS? Thats my burning question. If there

In the case of Emailer there are atleast two other mailers that are
better, MyMail and aMail. I use aMail all the time, and it really is a
nifty little program. It could use a better address-book though, but it
works under MagiC, N.AES, Geneva and MultiTOS, with MiNT-Net, STiNG,
IConnect and Draconis and it's *free*.

The problem is news, if you want to read news offline then I believe
Emailer is the best choice. I've never gotten the hang of NEWSie, but
since I prefer to read news online anyway (it's faster and cheaper) I
really can't say who's the best.

>> The same goes for Wdialog (has nothing to do with MagiC) I can't accept
>> that some programs refuse to start when wdialog is not available.

> Valid point. I sometimes cannot see the difference adding wdialog makes
> to my system...I tend to not use software that has 'conditions' of use!

Wdialog adds windowed dialogs to the AES. This is basically a Good Thing,
because it saves a lot of code in the applications and it gives all it's
clients a very similar look. The problem with Wdialog is the
implementation, it really only works well with older versions of MagiC.

Hi List,

I have the Supermon cartridge for my Atari STFM. Does anybody you have a copy of the set-time utility for the cartridge?? I have lost mine, but I think it was 2-digit year format. I got my cartridge about 8 years ago (I think) from Will Visser (Queensland Australia).

Perhaps you could send the .prg file by email?

Thank you.

Peter Smith

Very large planes are built by teams as well.
Falling PC's only hurt your toes. Failing PC's only damage your windows.
Thats the reason why a tight organization doesnt have priority in the
software business. Not because it is impossible.

It must be Bill's personality structure, he is not interested in a good product,
never was, never knew. I heard him say in a interview that he only employs
highschool graduates, because they do what he tells them. How to design
software is apparently not part of the story.

From Bill's very first interview in PC Magazine (1981):

"We'll be able to write big, fat programs. We can let them run
somewhat innefficiently because there will be so much horsepower
that just sits there." Bill Gates in PC Magazine, 1981.

I've got some Atari stuff that I'm willing to sell or trade for other stuff:
- SM124
- SM125
- 1040STFM
- 260
- 354 floppy drive
- clockchip for ROM-port

I'm interested in all kinds of musical stuff (instruments, cables,
effects...) and
especially in a MIDI expander for my TT (so no notator-thingy).
By the way, I live in the Netherlands...

I just want to see if gemulator could access the higher screen color
depths of the falcon. Running 800x600 in true color mode would be nice.

BTW. How many falcons were produced? Wasn't it something like 50,000?
Wonder what the potential as a collectors item would be.

Remove your modem from both the Atari and the windows and then
reinstall. Which is easier?
Now do the same with your mouse? Now unplug your monitor and replug it
in? Which is easier to install? Now connect a chain of modern SCSI
devices (I know USB is taken over) to both machines. Which is easier?

It would take a lot of work, but you could contact the SEC and get copies of their annual reports. The annual reports have a breakdown of products sold by category and area. You could then do a bit of math to figure out the actual price atari got for the machines. Divide total computer hardware sales by the price that atari sold tem at, and you can get a pretty accurate figure.

3264. .ST File to ST readable Disks

Newsgroup: comp.sys.atari.st
Date: 1999-12-02 00:00:00 UTC
From: Jon Black <Black@Hotmail.com>
Message-ID: <8263n3$n7n$1@phunn1.sbphrd.com>
Source record: 69559
Cross-posted to: comp.emulators.misc,comp.sys.atari.st,comp.sys.atari.st.tech

Hi all

I'm having great difficulty converting .ST game images into a floppy disk
to use with an original ST.

I'm using Makedisk, if the image has the standard 80/9 format the disk is
created with no erros but the ST will not boot from the floppy and if you
try and load the game from the floppy Icon the disk drive won't read it
properly and the game will bomb out while loading.

If the .st image is not a no standard format like 82/9 and I tell makediske
to us this format I get sector not founds errors etc all through the
creation process. If I force makedisk to use the standard 80/9 format then
the disk is created without errors but the ST then sees it as empty.

I've tried formating the floppies using dos switches to force 82 tracks and
9 sectors etc but then I get a drive incompatible error or just incompatible
settings and dos stops before the format begins.

I've tried four different PCs with dos 6.22, win95, win98 and win NT
I've tried to read the disks in a Mega ST DS/DD drive, STM SS/DD External
Drive, STFM DS/DD Drive and an DS/DD ST compatible drive of unknown make.
I've used DS/DD disks and HD/DD disks all with no success.

What am I doing wrong? I have four STs but very limited software which I'm
very bored of, I've downloaded games which I bought and enjoyed years ago
but I cannot get them over to the STs, so unless I can figure this out there
not going to be much use.

any help would be greatly appreciated.

Hi Terry,

>Let me put it this way. If I want to buy a new scanner, I know I can go to
>any computer store and buy virtually any scanner on the shelf (assuming I
>have the needed port). I know when I get home I'll have it up and running
>in 5-10 minutes. I don't have to worry about finding software or a cable or
>figuring out how to make it work on my computer. That is idiot-proof. More
>importantly, it's user-friendly.

Here's a little story....;-)
Imagine you bought a scanner two years ago, it came bundled with drivers for WIN95, a year later Uncle Bill released WIN98 and surprise surprise you need to update the scanner driver because that superb idiot-proof user-friendly OS doesn't want to know about the WIN95 driver. So you surf to the manufacturer website to download the newest driver, surprise surprise again, your model is not supported anymore....
Now, this has happened to hundred of peripherals, have you any idea how many piles of unused/obsolete printers, soundcards, graphic cards and yes even CD-RW's there are out there? in my book the life span of a printer or scanner is more then two years.... Uncle Gates did it when WIN95 was released making all the WIN 3.1 drivers obsolete, he did it over again with WIN98 and surely will do it with WIN2000 as well.

>Same with a CD-R, though installation will take a little bit longer than the
>scanner. But it's just as simple, and again, I don't have to worry about
>cables or software or anything like that. It's basically plug and play.
Is it? ever tried this with a PC running Windows NT 4...

>I'm not saying you need a degree in engineering to make those installations
>on an Atari. But to suggest that it's even remotely as simple as it is on a
>Windows machine is just silly. It's not even close.
Since you give examples which suits You best, so shall I....

Take a PC with 3 harddisks, 1 CD-R and 1 CD-RW, without an OS installed...

Partitioning those three drives, will not take me no longer then 2 minutes, the time that is needed to boot the HD-Driver masterdisk. Switching the computer off and rebooting from C, I now install a CD-R driver, this takes just a couple of mouseclicks... same thing for the CD-RW....
I'm now ready to go ;-), how are you doing so far? with the idiot-proof and user-friendly OS....

You call this extreme? I'll give you an extreme example....
Using a TT, I'll connect 10 Harddisks, 2CD-R's, 1 Scanner, 1 CDRW, 1 modem, 3

printers, 1 graphic tablet and 2 monitors to the *standard* interfaces.
Setting all this stuff up requires 1 Harddisk driver, 1 MetaDOS driver, 1 NVDI,
1 Scanner driver and 1 graphic tablet driver...
I can set this whole thing up and running in less then a half hour... what
about you with the idiot-proof user-friendly OS?
Oh, I just noticed some more interfaces.... I'll attach a MIDI keyboard and an
Eprommer as well, this will take 10 more minutes to setup..
Oh, I overlooked the LAN port, what the hell...lets's attach a serial cable to
it connected to another TT with the same configuration :-))

I would love to be a fly on the wall, and see You set up something similar in
less then an hour, fully working!!

>But to suggest that it's even remotely as simple as it is on a Windows machine
>is just silly. It's not even close.
Regarding the examples given above this statement makes me ROTFL :-)

>Regarding running software out of a folder placed anywhere, virtually every
>Windows installation program I've come across allows you to choose where to
>install it. It usually defaults to C:\Program Files\whatever, but it's very
>easy to change it to where you want it. So I'm not really sure what you're
>getting at there.
You're not sure? :-)))
Suppose Calamus is installed on partition D, for whatever reason I want it on
partition E. We'll take the Calamus folder and copy/move it to drive E, and
that's it.... I like to see you move PageDesigner from C to D and starting the
program afterwards... :-)))

Terry, what are you trying to proof? this is the CSAST newsgroup, you will not
convert one single person here..... If I wouldn't know any better I would say
you're a Sinclap clone....
Why can't you and other users of the idiot-proof and user-friendly OS, get it
in their heads, that we're perfectly happy. No one is forcing us to keep on
using Atari computers, we actually enjoy using them....
A PC is something I (got to) use at work, back home in my own free time I can
actually use what I enjoy using and it's certainly not a PC.

Cheers from Belgium
Dennis

Hi Peter,

>DV>From the three available browsers Draconis holds three titles: - it's
>DV>the most expensive of the bunch - it's the worst of the bunch - it's
>DV>the slowest of the bunch

>that's your opinion. I think you're not right, for
>- ok, with the price you're right, but compare to PC software...
>- no, I think it's in the range
>- and it's (a little bit) faster than CAB.
Yep this is my opinion and I'll clarify it a bit more...
- the price is not really my point, I'm willing to pay twice as much if the software does what is promised, and no I don't compare PC software, I'm an Atari user using a Atari. I don't give a damn about what's happening on the PC platform.
- it's not in the range, it's definitely the worst of the bunch. CAB is rock solid, as you probably know. WenSuite has a lot of flaws, but at least one can use it offline, it will not bomb out at random...
- The speed of CAB is nothing to shout about, I just tried out loading the latest ATOS html archive offline, pics not yet in cache... guess who's the slowest....?

>I have been using CAB with ICONNECT since 2 years and after all, I'm
>satisfied.
Same here :-)

>And after one week, I think it's good, it's not optimal and may be
>improved, but all in all it's ok.
It's OK ? Compared to what Peter?

>Conclusion: Your statement is not totally false, but you exaggerate a
>bit.
There's nothing false about my statement, I rather would have liked to be able to rave about it, unfortunately this is not the case....I've given the facts as they stand. Nothing more, nothing less.
The only point to buy the professional version of Draconis, is the supposed JScript support, since you find it *good* could you give us some links of sites that you can actually access with Adamas? without getting error alerts or worse... bombing out. Even a site like Hotmail that uses only one single applet is too much for Adamas.

>DV>Will it be free? I have no intention of paying these clowns one single
>DV>penny anymore. If so, can I download the upgrade? with what? not with

>DV>Adamas that's for sure!!
>No, it's not free, even I (purchaser of the recent 1.63) will have to
>pay the posting (twice).
Ahh, that's where service comes in.... I bought it on the 16th of september, and was send version 1.62, a week later version 1.63 arrived. MUCS knew very well that version 1.63 was coming, instead of holding the order for a couple of days....:-(

Copying/moving "gemulator98 online documentation.html" is not a problem in
MagiC for Atari. I've extended it to 63 characters, that's the maximum that
the input line of Jinnee allows and it is displayed correctly.
What desktop are you using with MagiCPC?

>
>But Atari browsers DON'T get the job done. There are many sites you can't get
>on at all. And others you can get on, but can't do anything functional, like
>online banking and shopping. And even when it IS getting the job done, it's
>slow as molasses on most Ataris.
There's more in life then just browsing...
In the time that it takes for Windows to boot, the slowest Atari will already
have made a connection to the ISP and be downloading the postings in this
newsgroup.
Can you send/receive email, ftp, telnet, ICQ ..faster then I do? a 56K modem
remains the same thing when it's connected to a PC.
Can you type faster using MS Word? can you input data faster in Exell? can you
burn a CD faster using WIN98? etc....

For certain tasks it doesn't matter which OS or computer one uses, have you
noticed that in the example some of the most widely used applications are
included.... writing letters and email... a 15 year old Atari 520ST does the
job just as fast and sometimes even faster. We're not all blinded by the
hype...

Cheers from Belgium

Hi Jo Even,

>he thing I dislike about ASH is that many of their products offers less
>functionality under anything not MagiC, and still costs more than if
>you're using MagiC ("power user")... Here in Norway that would be illegal,
>I don't know about Germany but it's IMHO definitely unethical.
I think you and a lot of people here misunderstood the concept "power User".
One doesn't have to own a copy of MagiC. When you have bought *any* piece of
software from ASH (not SysSol) you automatically become a "Power User" once
it's registered.
If for example you bought CAB, then you're entitled to buy say Kobold, NVDI
or even MagiC at the "Power User" price...
Since most of us have at least one piece of ASH software, it's safe to say
that we're all "Power Users" :-)
ASH doesn't care if you have MagiC or not. Perhaps this is illegal in Norway,
but over here in Belgium it's done constantly. When I buy a pair of shoes or
jeans I'll receive a "client card" giving me a discount on future purchases.

Cheers from Belgium
Dennis

Phantomm wrote in message <3846417b@athene.hdm-stuttgart.de>...
>
>First off, can I use any Keyboards that have MIDI ports with the
>Falcon?

Yes - all MIDI ports are compatible with each other. Yhat was the whole idea of MIDI - to make all devices able to communicate with each other, regardless of manufacturer.

If so, will most of the MIDI software for the ST/STe work on the Falcon in at least 640x480 resolution?
>
>Now, can I use the Keyboard connected to the Falcons MIDI ports and
>do D2D/Memory Recording from the Keyboard thru the MIDI ports to either
>Memory or the Hard Drive?

That I'm not sure about. MIDI ports have no audio - just info about what notes are being played, what velocity, etc. So connecting a MIDI keyboard to your MIDI ports will allow it to interface with the sequencer or other software which could then play the MIDI file and record it as audio, but I'm pretty sure (I'm not familiar with the Falcon or software) you can't record straight to disc, because of the nature of MIDI itself.
>If so, what software will allow this on the Falcon?
>
>If the above cannot be done, then I should be able to do it thru the
>Falcons Audio Input, does most MIDI keyboards have some type of Audio
>Output that would allow this?

ALL MIDI keybards should have an audio out, otherwise there would be no way to get the sound to an amp to be heard. There are some keyboards which don't; these are called controllers and have no synthesizing or sound producing capabilities of their own. I suspect though, that this is not the type of keyboard you're looking at.

>
>I notice some different ports on the MIDI keyboards other than MIDI
>in/out, what type of other ports should I look for when purchasing
>a MIDI keyboard for use with the Falcon?

A MIDI through port is nice to have. It allows you to hook up several MIDI devices from a single location.

Hope this helps.

You may see no future in CAB, but regardless, grab the 2.7 demo. It handles
tables much faster and has many more features. Quite useful and only
hotlist is disabled. Keep 1.5 to save hotlists, then load into CAB 2.7.

Later Brian.

Hello

The new english version of WenSuite in available.
This is the v3.30b. It corrects all the bugs
introduced by the v3.30a and many others.
The history file is now available in english.

Go to http://oxo.systems.online.fr
and click on the DOWNLOAD link

Enjoy!

the OXO Systems team.

>It seems that Kobold (version 3) somehow has problems with long
>filenames. Does this sound reasonable?
>What's the latest version of Kobold by the way?

Kobold 3.5, which is the first to handle long file names. At present
only available in German, though I have translated it for a British
distributor (but don't know when they will release it). I hear rumours
of Kobold 4 in Germany - don't know what's new in it.

>I've tried creating folders/files with long names, but if Kobold is set
>up to delete and/or copy under Thing it refuses to do the task. Often
>without an error message! (quite unfortunate really -just imagine you're
>copying files over to another folder, then delete the original!)

Yes, that's likely with the earlier versions - you may be able to get
round this by using GEMDOS mode, but in that case you lose most of the
speed advantage, IIRC.

Regards, /Peter/

There is no good way to know what Atari got for the machines.
Certainly dealers and retailers took a cut. As to looking it up, the
SEC has the Edgar database available from the net. Sorry, I cant
remember the URL.

Scratch that. I found it.

I'm not worthy of such praise... ;-)

I guess the next problem will be purchasing the package from abroad. I'm
not sure what process the OXO guys have in mind.

At this moment there is a new 3.30b which fixes bugs that people have
had with the previous version.

OTOH, using Agent I can download headers from dozens of groups in almost no
time, automatically getting the bodies of only those threads I've told it
to. And I can quickly and easily get bodies of any new threads I wish.

>Can you send/receive email, ftp, telnet, ICQ ..faster then I do? a 56K modem
>remains the same thing when it's connected to a PC.

Well, yes, I can. I'm using a cable modem. Let's see you do 512K on an
Atari.

>Can you type faster using MS Word? can you input data faster in Exell? can you
>burn a CD faster using WIN98? etc....

I probably can type faster, because I'm using a real keyboard (and can
easily swap it out if I find one even better). I may not be able to
actually burn a CD faster, but I guarantee you I have a lot more options
available to me about what to put on that CD.

>For certain tasks it doesn't matter which OS or computer one uses, have you

Nor am I blinded by the Atarian cult.

I've been using Ataris since the 800XL first came out. I only recently
started using a PC. So I know the differences. I'm not a victim of some
marketing hype. I made an informed decision when I made the switch.

As I said above, I find it a somewhat unfair to judge version 3.30 from
using the 3.20. There are quite a lot of bugfixes in the last version,
and they are actively getting input from users to improve it constantly.

This is not possible. WenSuite uses exclusively its own TCP/IP stack
which is included in the program.

>
> What is the registration cost for wensuite and what are the limitetions for

You have to buy the package from OXO at the moment, and I'm not sure how
they are planning to handle exports.

I find it a bit unfair to judge on this old version. There is a 20K
hist.txt file that goes from 3.11 to the 3.30a

Sure, WenSuite is not yet fully functional (FTP or add-on), but most of
the issues above are either documented or corrected in this latest
version.

OXO's policy is that users would probably rather have a semi-complete
package now, than wait for 5 more years for a fully fledged suite.

> I know of several people wrestling with it on their Milans and they
> cannot even get it connecting. That's at least what I got working over
> here when I skip the messed up modemcommands.

Have they tried contacting OXO ? I have found them very supportive. They
have already responded to a few bugs that were in last week's release
with a 3.30b.

> Somehow the only people getting it to work (decently?) are Mac users
> running MagicMac....

This is wrong now. Most french users are quite happy with it now. The
MagicMac issue was because that used to be their development platform.

> Again, maybe all these probs have been fixed in the latest version,
> but to be honest, I won't believe that until I see it with my own
> eyes.

Go ahead and try it then. It's only a 400K download, and you already
have a serial number for it.

I personally use Videl Inside, which runs pretty much in the way. I use
it in 768x560 which is noticeably faster than the 800x600.

> What I was wondering was... Is there anything like this for the
> TT?

No, this can't be done. The Falcon has a flexible Videl chip which can
be programmed, the TT has fixed hardware.

These are not sold any more, so you'll have to find it second hand
somewhere. Cash Converter shops or local ads are a good place to start.
Web auctions are good too, but it might be a bit late now for Xmas.

The model of monitor you want depends on his use of the computer. If
it's used mostly for games, you need a colour monitor (SC1224, SC1225,
SC1425, basically SCxxxx). If it's for serious apps, a high-res mono
screen is better (SM124, SM144 or SM125).

I'm using Windows 2000 right now. I'm using basically the same software I
was using in Win98. The only driver I had to manually update was my CD-RW
driver. No big deal. There are dozens of choices. W2K is a huge
improvement over Win98 (though I realize it comes from the NT line), and I'd
rather see the OS continue to evolve than to retain 100% compatibility. No
one forced anyone to upgrade to Win95 or Win98 or even W2K.

>>Same with a CD-R, though installation will take a little bit longer than the
>>scanner. But it's just as simple, and again, I don't have to worry about
>>cables or software or anything like that. It's basically plug and play.
>Is it? ever tried this with a PC running Windows NT 4...

No, but I have with NT 4's successor. Not sure why you'd compare Atari's to
the NT, anyway, as the NT was never meant to be a consumer OS. User
friendliness is not nearly as important in the corporate world, where
professional installations and upkeep is the norm. Of course, W2K is
starting to change that anyway.

>Take a PC with 3 harddisks, 1 CD-R and 1 CD-RW, without an OS installed...
>
>Partitioning those three drives, will not take me no longer then 2 minutes,
>the time that is needed to boot the HD-Driver masterdisk. Switching the
>computer off and rebooting from C, I now install a CD-R driver, this takes
>just a couple of mouseclicks... same thing for the CD-RW....

First, why would I not have an OS installed? And second, how are you
booting your Atari without an OS installed?

I can boot Partition Magic from a floppy, if that's what you mean. I can
then split, merge, and create new partitions without losing ANY data. I can
make them FAT16, FAT32, NTFS or Linux partitions, and mix and match as I
please. If I decide later that I want to change the partition type, it's
very easy to change them, again with no loss of data. If I don't like the
size of my partitions, again, I can change the sizes with no loss of data.
Need another partition? Okay, no problem...no loss of data. Too many
partitions? Okay, let's get rid of one. Again, no loss of data.

>I would love to be a fly on the wall, and see You set up something similar in
>less then an hour, fully working!!

Not sure why I'd want all that stuff connected, but if you're' trying to say
some things are easier on an Atari, I don't dispute that. The setup you
described is far from typical, though, and you're still very limited in the
software you can use. For Joe Average wanting to add a new peripheral to
his computer, I still maintain it's generally much easier on a PC.

>Suppose Calamus is installed on partition D, for whatever reason I want it on
>partition E. We'll take the Calamus folder and copy/move it to drive E, and
>that's it.... I like to see you move PageDesigner from C to D and starting the
>program afterwards... :-)))

There are programs that allow you to do that. But I admit that it's easier
to move programs around on an Atari. I've already stated that.

>Terry, what are you trying to proof? this is the CSAST newsgroup, you will not
>convert one single person here..... If I wouldn't know any better I would say
>you're a Sinclap clone....

I'm not trying to prove anything, nor am I trying to convert anyone. I'm
simply offering a different perspective. Is this group only for those who
belong to the Atari cult, where opinions not 100% pro Atari are not welcome?

I have no idea who this Sinclap guy is. I'm only trying to offer the
perspective of someone who has used Ataris since the 800XL was first
introduced and who has just recently started using a PC. I've been
subscribed to this newsgroup for years. I didn't just start coming in here
to try and convert people (why on earth would I waste my time doing that?
Bill Gates doesn't need my help). Again, I'm just offering a different
perspective.

>Why can't you and other users of the idiot-proof and user-friendly OS, get it
>in their heads, that we're perfectly happy. No one is forcing us to keep on
>using Atari computers, we actually enjoy using them....

And if you've read all my messages, I've already stated that if people are
happy using their Ataris that's great. Just don't pretend it's something
it's not.

>A PC is something I (got to) use at work, back home in my own free time I can
>actually use what I enjoy using and it's certainly not a PC.

That's fine. I enjoy using my PC. Again, I'm not trying to convert anyone.
If you've gotten that impression, you're reading more into my messages than
what's there.

A new beta was uploaded tonight. It fixes a few serious problems so I
suggest that everybody who downloaded 2.70b upgrades.

Ofcourse you can. The main trouble is that Woller and some others doesn't anser to mails. I'm sure Woller speaks English (I talk to him at the Hannover fair) so that's is not the problem. What's the problem then? I don't know. For me it looks like Woller and Co doesn't want to do business with non-German.

You forgot one, Okami v2.x. It's IMHO the best offline reader for the
Atari platform. It runs under plainTOS, MiNT and MagiC. I don't know it
works with Geneva though. I believe the programmer of Okami 2.x told me
once that Okami won't work with Geneva.

Oke it adds some things but a program which use wdialog should start
without too. Papillon for instance needs wdialog for printing and
font handling but it can be used without wdialog.
This can't be said of Olympia which simply refuse to start.

I'm using Freedom for quite some time now. Mostly I hadn't (or I didn't
recognised it as a fault of Freedom) much trouble. I do love Freedom 2.5
but with the setup I'm using now I start getting troubles. With pain in my
hart I just decided to drop Freedom in favour for Boxkite.

As I can't use the Iconnect clients under N_AES I can't tell you if it's
worth using. One thing though, even if I could use for instance ASH-mailer
I wouldn't use it because IMHO Okami is far better then ASH-mailer.
I've seen MagiC 6 working on a Hades and to tell you the truth I don't
like it at all.

>for Systems For Tommorow.

As this is about the shareware scheme tha I personally run I think a
few comments are in order for everyone's benefit.

Firstly, apologies to all thosewho have registered software via my
shareware scheme and have not yet received the goods.

This is mainly down to:

1) The Internet Services Company I own has taken off beyond belief.
here is so much work involved with that and thus everything else (even
my personal life) has taken a back seat.

2) We attended and had a stand at the recent Atari show in the UK. A
lot of effort went in to preparing for that - we had the flyers, logo,
banners designed and printed.. co-ordinating the staff (we all live
and work from different places in the country) and geting everything
sorted out in time for the show took all of us a lot of time.

3) Since the show, my shareware computer sill remains unconnected -
due to lack of time. Mainly the Internet company, and secondly, we are
in the process of moving house.

4) The shareware side is a hobby and not done for money really - to
live I have to earn money and thus he Internet side takes priority.

I do promise to get the shareware compuer connected up this weekend
and send out the keys/masterdisks/etc to all those that are
outstanding and can only apologise for the delay.

This may also be a good time to mention the future of CyberSTrider
Shareware Scheme...

For a while now, it has become more and more apparent that the
shareware scheme is very unprofitable to run - the aim was not to make
money from it - but it doeshurt when it constanly makes a loss - ie,
money out of my own pocket... and we are not talking just a tenner hee

or there either.

For this reason, I decided back in March to close the shareware scheme as it currently is - I do remember mentioning this around then on the newsgroups too.. and he idea is to wind it down by the end of the current tax year (ie, 5 April 2000)

CyberSTrider started to allow people in the English speaking worls register software from authors int he non-English speaking worls, and at the same time pay in GBP or USD

CyberSTrider has always been internet based - all the way back to 1993 when it started. It originated on the net. And now, as my own internet services company offers ECommerce facilities - even to those who aren't eligible to take credit cards anyway, can do so. Most of the shareware registrations now come in via the web site with people paying online by credit card.

As such CyberSTrider no longer plays a value added part in Atari shareware, and procedures are being put in to place which will either allow the author to take CC via their own web site or we still take payments via CC on their behalf, bu the order gets channeled direcly through to hem for processign themselves. Thus CyberSTrider is out of the direct loop and processing of orders will be done by he authors and much faser than I can now possibly do.

My Internet company is moving more and more toward portal and online shopping mall development - software payment does fit in to this.

As mentioned above - I'll be dealing with the shareware this weekend.

Regards
Denesh

Is the software worth using though, even under MagiC? Are there better
equivalents that work under any OS? Thats my burning question. If there
are better equivalents it would be better to use those than to have to
put up with MagiC (which seems tricky for some people, mainly due to
some difference with their hardware?).

> The same goes for Wdialog (has nothing to do with MagiC) I can't accept
> that some programs refuse to start when wdialog is not available.

Valid point. I sometimes cannot see the difference adding wdialog makes
to my system...I tend to not use software that has 'conditions' of use!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Sorry Jo, that wasn't aimed directly at you. There ARE those lurking
in this NG who without fail will rubbish any ASH product that other
Atari users are having trouble with...

> Sure, there's a lot of
> things I don't like about much of the software ASH distributes but there's

True. I've never used ASH software (other than MagiC) due to cost
and the level of problems users report about it. I've always been
one to use shareware stuff (mainly because it works better than
much commercial stuff I see!)

> But the fact is that some of their software, like CAB, is
> advertised and sold as TOS-compatible, although they need MagiC for much

> MagiC and can't use the software to it's full potensial. Why shouldn't I
> complain??

I've only been able to get CAB working (v2.7) nicely under MiNTnet, which
was ages ago. I only had the AES 4.1 GUI therefore my system felt like
cold molasses compared to 5W20 slick oiled feel I was used to with MagiC,
but at least it was stable. I just couldn't tolerate the way the GUI
reacted (or didn't react) to user input under the MiNT setup I had. Also
I have considered NAES, but have decided not to risk that (non-german
peoples cannot get it?)

Message-ID: <B46B1CA3.6BA%collins@bulli.com>
Source record: 69633

In less then half a week the Atari community will see the end of the first (annual?) MagiC Game Contest.
On December 5th, we (Jan and Myself) invite ALL Atari users to download the submitted entries and decide first hand, which game deserves the "First Place" label.

Now, to the programmers:

Due to unforeseen circumstances, there is a possibility that the organizers of the contest have lost (due to computer problems) certain contact information. Currently, We have the following Games officially registered and are awaiting final versions. :

Rosemary Rancoons Stripgame (Rajah Lone)

AtariGO (Herbert Walz)

BoinkOut 2 (Dan Ackerman)

GEMPeaks (Christian Putzig)

FANWOR - Legend of GEMDA

Asteroids (Mario Becroft)

Pentagon (Mario Becroft)

To be announced (Mario Becroft)

AtariGO(Herbert Walz)

MagiC Lands .**(Mark Wherry)

Monopoly (Matthias Jaap)

**Registration pending

However, we have lost contact with /ATLEAST/ the authors of the following games:

Dirk H of GEM Kicker: PLEASE CONTACT US ASAP

Odd S of GEM Galaga: PLEASE CONTACT US ASAP

Jo Even E / Defender clone(?): PLEASE CONTACT US ASAP

Any other Programmer: If your name is not listed here and/or you have yet to get in contact with us with your game, you only have 4 days!

Final notes:

If everything goes according to schedule, a Visit to one of the two official pages on December 5 will allow you to download the complete archive, including ALL entries and vote forms. THE VOTE FORMS MUST BE RECIEVED NO LATER THEN DEC 25/99. Past due date forms WILL BE IGNORED. Individual votes will not be made public. Authors ARE allowed to vote for themselves.

On December 25th, 1999 the results will be made public on MagiC Online

http://bengy.atari.org/
and
the place 2 be
http://place2be.de/

We look foward to your questions and comments and hope that the public sees this project as a beneficial and successful Atari event.

Take Care,
The MGC Team

Some people in the Amiga world were working on a "Mac 060" PCI card
for PC's a while back. From the looks of the web site, they have given
up. That would have been a cool setup to have MagiC Mac on the 060,
but I guess with the Milan running MagiC now, it wouldn't be worth the
cost.

I have for sale a nice Atari STe Computer System. :)

Brief details of package:

Atari 1040 STE with 4 megs of Memory and TOS 1.62
This STE is a Nice one, No DMA problems. Used very little, hasn't been
hacked on. In Excellent working condition.

Atari MegaFile 30 Hard Drive
Good Stable Hard Drive, used very little, In excellent working condition.

This package comes with various original software and hardware.

This computer system was suppose to be sold, but the Buyer failed
to get payment to me. So it goes back up for sale with the Price
Reduced on the whole package and more stuff added.

If you are in the market for a good Atari 1040STE System then this one
is worth asking about. Only selling due to lack of space for it.
If I had a Bigger House, then I'd keep it. ;)

Overseas buyers are also welcome

Will consider a Trade, but only for Atari Falcon hardware/software.
Will consider selling just the hard drive or the computer.

Computer system comes with a limited Warrantee. :)

If Seriously Interested then e-mail me for a complete description of
the system package including price.

It's a good machine folks ;)

3317. MIDI Keyboards on Ataris

Newsgroup: comp.sys.atari.st
Date: 1999-12-02 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <3846417b@athene.hdm-stuttgart.de>
Source record: 69642

Believe it or not I just got my first pair of MIDI cables the other day. Have never used my Falcon or other Atari ST machines for anytype of MIDI related stuff.

I do have some MIDI software but have never looked at it, have always used D2D recording software on the Falcon.

I've seen some nice looking Musical Keyboards that have MIDI in and out ports on them and was considering getting one for use on my Falcon.

I'd like to use the MIDI Keyboard for creating Music and Sound Effects with the Falcon. I know alot about D2D Recording and have lots of good software for that.

First off, can I use any Keyboards that have MIDI ports with the Falcon? If so, will most of the MIDI software for the ST/STe work on the Falcon in at least 640x480 resolution?

Now, can I use the Keyboard connected to the Falcons MIDI ports and do D2D/Memory Recording from the Keyboard thru the MIDI ports to either Memory or the Hard Drive?
If so, what software will allow this on the Falcon?

If the above cannot be done, then I should be able to do it thru the Falcons Audio Input, does most MIDI keyboards have some type of Audio Output that would allow this?

I notice some different ports on the MIDI keyboards other than MIDI in/out, what type of other ports should I look for when purchasing a MIDI keyboard for use with the Falcon?

Also could use a list of good MIDI software for use with the Falcon. And any Tips/Hints on what to watch out for when starting up a MIDI system on the Falcon.

Future Thanks,
phantomm@kih.net

Export is (was) made by C-Lab and connects to your Atari's COM port to
give you 3 extra MIDI outs to the Atari's existing one. I have only
used it with Notator and don't know whether other software can use it.
It's probably hard to find.

: easy to use as well as stable (never had any problems with it). The only
: drawback as we all know is the lacking long-filename support.

: Anyone know if there is any chance of an update? Is the author reachable
: at all via email?

I think the two popular file selectors now are Boxkite and Freedom both of
which support "long" filenames. I had much trouble with Freedom and I
understand a lot of other people also have problems (causes crashes even
of other programs apart from Freedom itself). Boxkite, from what I
hear is better, but I have not used it much myself.

I just use the simple file selector included with N.AES... it is not very
fancy but it works (and supports lengthy filenames).

All of the above programs display in a window and allow other apps to be
operated while the file selector is visible.

I would strongly recommend *not* buying from any dealer that doesn't
accept credit-cards. So far I've prepaid goods for almost DEM1000 and I've
not received any of it yet :-((No, not from Woller this time). OK, I
admit it, prepaying is stupid and braindead, but what can I do when it's
the only way to get any new hardware?

$69.95 direct from PowerQuest. A little cheaper in stores. It's pricey, but well worth it if you have a huge hard drive and need to make some changes. Backing up, partitioning and restoring all that data would not be fun, especially if you had to do it multiple times.

Although it's a HUGE download (if you buy it online), you can run it off of two floppies, including the Windows installation. You don't have to have anything installed on your hard drive. Even the included BootMagic can run off of a single floppy.

Of course, I just bought a 14GB hard drive for less than $200, so file space is becoming less and less of a concern.

I'm afraid his is talking about the Whileline CD series -The complete Atari MiNT 1998- and not about the MiNT'98 distribution CD from Torsten Lang and Bernd Ebert.
The first one holds only -as the title mentions- the free MiNT stuff. You can find on that CD a demo of Cab 2 (German version), a whole bunch of MiNT stuff. It also holds the complete KGMD, MDK-new and TAF packages. The MiNT kernel include is ofcourse an old one, freeMiNT 1.12.
Furthermore it holds also a html-based MiNT cursus but unfortunately in German.

The MiNT '98 distribution CD however contains a very easy-to-install MiNT package. I can recommend this CD. I've installed this CD on a TT030 in only 30 minutes. On my Hades it tooked a little bit longer because for some reason the package refused to make a minix partition.
I also tried to install it on a Falcon with a memory expansion but here I failed. I can't remember me the warning I got but I had something to do with the memory. Something like this 'pid .. MEMORY .... Type hardware '
The only drawback is that the whole installation procedure is in German.

Martin "Nightowl" Byttebier <tos4ever@online.be> wrote:

> Oxo told me once that they are working on some kind of MiNT-net bridge.

Now they're starting to make sense. If they can only open up their API
then others can write overlays for IConnect, Draconis and STiNG as well,
or even go the other way and write STiNG- and Draconis-overlays for
Wen.Suite.

Anyway, I tried 3.30b today, and to my surprise it *finally* worked on my
AB. All previous versions have crashed immediately regardless of OS or
cache-modes. I could barely start it up on my TT.

My impression is that it renders HTML pretty fast and well, but it's so
bug-ridden that it's unusable. First of all, it's hard to configure
because of the poorly designed GUI. Now that's pretty usual for French
software (sorry folks, but that's the way it is...), so it didn't surprise
me. What surprised me was that it didn't work with my Nova graphics-card,
it was impossible to save the configuration and it didn't work online. Do
they really expect people to register based on this??

So far I have to say that it looks better than Draconis, but Draconis
works. What Draconis miss is a decent GUI, it looks like it was made on
a 1040 back in 87. I've used it a bit with Frank's Draconis<->MiNT-Net
overlay, and I'm quite satisfied with the stability and features.

There is a documented fix for this in the docs. I should know, I
translated them!

As for the GUI, well I've seen worse. All of the setup options are
neatly layed out it tab dialogs, so I don't see how they could be easier
to find. Setting up PPP is just a matter of filling in your
login/password, phone number and DNS settings. How easier could that be
?

I should work, at least it works with my Mach 64 card.
One strange thing however. When used on a MiNT NEWFS/VFAT partition
Wensuite creates a dir without name the first time it's launched. I told
this to the programmer quite some time ago but it seems he can't find a
solution for this strange behaviour.

Just like there are still now a lot of people who still want to do it
the old way with Ataris, amigas etc... Will you be there to point out
that heir hardware is obsolete when you move on to newer technologies.

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

(Update: 11/18/99) I've just added more 8 Bit Software to my Catalog. Programming Languages & DOS's from OSS, HOFACKER, Alpha and even Atari MicroSoft BASIC & Atari LOGO. Lots of Utilities & Copiers like Chipmunk and Impersonator. My Catalog is growing by leaps & bounds.

(Update: 11/04/99) I've just added a bunch of Titles to my Atari 8 Bit SoftWare Catalogs. All Games!!! A number of them are UnOpened! Many for only $5 a pop! And I went through my Catalog and did some adjusting of prices. Right now my 8 Bit SoftWare Catalog has a bigger Byte count than ever.

Atarians Unite! Are you pining for the days of a simpler Computer? Do you miss Arcade Classics like Asteroids, BattleZone, Joust, Missile Command, Robotron 2084 and my favourite Star Raiders! Well Bravo Sierra Computers has them. Are you wandering, wandering in the desert of violent video games. Games too violent for children? With Blood & gore? Two companions of youth nowadays. Especially those you hear about in the news who kill fellow students at school. If your preferences for games lean more towards family friendly. Like it used to be. Try some of my Atari Arcade classics. I have oodles of Atari SoftWare! As well as truckloads of Atari HardWare. And Libraries of Atari Books. Reference material and things you thought you'd never find! So come check it out. The best of Classic Atari 8 Bit & Atari ST. E-Mail me at

e-mail: atari@benjamin.net

Or call me anytime at (503)256-9974 to talk to a warm, friendly, people person! Your more likely to reach me from 3 PM-3 AM Pacific Standard time. And thats most likely the times I can return calls. I'm perfectly willing to call you, on my own dime to answer your questions. I'm a people person and those who have dealt with me will find me patient, a good listener and even a good teacher. So if you can't call me Today? Call me Tonight!

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact check it regularly as my Catalogs are updated regularly. I have 6 different Catalogs, and my SoftWare Catalogs are my

largest. They have the biggest Byte Count. And remember if you can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. >Yawn:-(. This is totally irrelavent to anything Atari. Talk about two PC
>software programs on a PC NG and NOT HERE!!!

It's totally relevant to the thread, which is basically comparing the ease of use of Ataris vs. PCs. And because Ataris are part of the comparison, it's completely on topic for this newsgroup.

>Your New computer is what is in you now. Lots of people hold your opinion.
>They are found on other NG.

So? I didn't come in here promoting PCs. I simply responded to comments made by others, when I had a difference of opinion. Sorry if you have a problem with that.

>There was a time when you had alot of knowledge and information to share
>about Ataris to Atari Users. You are not the first person to use/buy a PC
>or leave the Atari. You will not be the last. I certainly hope in the
>forthcoming months your posts are more about Atari and less about Your PC.

All my posts so far have related to the Atari in one way or another. If you consider it taboo to even mention other brands, oh well.

>We are a pretty good group of people here.

Agreed. And many of them have had intelligent discussions with me on this subject without bitching at me to leave because I'm no longer part of the cult. Some people are afraid of intelligent debate and some aren't.

>But what I can suggest since many, many, many, many of your posts have
>somehow managed to turn just about every Atari Subject into a debate on the
>merits of your new computer, I suggest you spend more time in
>comp.sys.atari.advocacy.

I'm perfectly happy here, thank you. I have no interest in Atari advocacy, either pro or con.

>When you can use your knowledge and information more directly related to
>Atari Topics I will welcome your postings, as I have in the past.

No offense, but I won't lose any sleep without your endorsement of my messages. Every single one of my messages have been on topic.

Who made you the group messiah, anyway? Does everyone solicit your endorsement of their messages?

>P.S. I intend start a thread in comp.sys.atari.advocacy that is more
>related to your thoughts about PC Hardware and Software vs Atari.
>This is the more correct forum.

Best of luck with it. I won't see it.

>Also TIFKAS is someone whom you are not. It takes a very long time to earn
>such an unwanted title. TIFKAS is simply a troll in that forum.

No idea who or what you're talking about.

Has anyone used "The Complete Atari Mint 1998 CD" to install a
working Mint setup?

Need to know if this is a good CD to get a good stable MINT system
setup along with Net access using Mintnet?

I know this probably isn't the current version of MINT, but is
everything needed on this CD?

Also, is any of the software on this CD like special versions or
copyrighted stuff or is it basically just a collection of Mint
stuff that one can download from the Net?

Any help is much appreciated,
phantomm@kih.net

From: phantomm@kih.net
Message-ID: <38471cf8@athene.hdm-stuttgart.de>
Source record: 69523

I've got a AlberTT graphics card installed in a MegaSTE and have never been able to get it working.

I've got a old 14-15 inch Multi-Sync monitor here but it doesn't have a 9 pin monitor port which the AlberTT needs afaik.

Can one use a monitor adapter with the AlberTT card to connect it to monitors that don't have the 9 pin monitor port?

Maybe the AlberTT needs sometype of special Cable to work with monitors?

If you have a working AlberTT setup, could you post or e-mail some info on how you have it setup to work, Type of Monitor and monitor cable you are using?

I've tried 3 different monitors and haven't had any luck getting anytype of display. So the card may be bad or I've not got something set right.

phantomm@kih.net

Hi all:

For the past year I have tested and used many programs on the Falcon, Pentium and Mac. I do agree that every computer has something to offer. For example the Falcon can do CD REC as fast and as well as a Mac but the available software is very limited, the Music
software for the Falcon is great so I do my recordings on the Falcon and then transfer the files to my Mac. On the Mac I use Toast for CD Rec, this program is the best I have used and I tested many. When I had only 4 megs of Ram Toast made cds just fine.

I tried almost evey program for cdr on windows and had lots of trouble. My friends Pentium has 128 megs of ram and still
has to use virtual mem! > Besides, I hate having to reboot the windows sys soo many times and having to run scan disk :(

The Mac is a great computer and the programs run fast and solid, I just do not like some things like getting all the finder windows covering my applications, the Atari desktop is way nicer :)

I think a PC with SoftMacc would be much better than a PC with WindowsXX.

So, I will always keep my Falcon and I do feel that having and Imac would be very nice, The Imac is a very good computer.

The Falcon and the Imac are a powerful combination. (my best friend has a new Imac I get to use :))
Raymond .

I use cable-net on my TT, but then I have a Riebl card on it.
Anyhow, most cable-modems require a machine with Ethernet card.

It works rather well, except I had to request my own static IP,
because neither MiNT-Net nor STiNG support DHCP. However, on most
operators, one cannot get a static IP or otherwise has to pay a
rather hefty extra amount to get one.

On average, using MiNT-Net 1.04 through the Riebl, I get between
18000 and 25000cps, using aFTP. Web pages load super fast on CAB
(especially since 2.8, because it has improved JPEG unpacking).

3347. Atari Web site: UPDATED!

Newsgroup: comp.sys.atari.st
Date: 1999-12-03 00:00:00 UTC
From: Nurmix@socal.SPAM
Message-ID: <8281rd05fp@enews3.newsguy.com>
Source record: 69530

Just a little note to let you all know that NURMIX WEB CENTRAL has received a major update to the Atari pages.

http://www.tsotech.com/nurmix/home.htm

I've been working on it for the last few weeks, and it's pretty much done at this point (at least the basic structure is done - I plan to add a lot to the DOWNLOAD and LINKS pages in the very near future).

Anyway, it was completely done on my Falcon using QED/CAB and various graphics programs for the images. Please, take a look and let me know what you think.

There is a sort of "Atari History" section, detailing both the 8-bit and ST line. And a section about my personal story/history with Atari computers, in addition to the links and download pages.

And also, if you'd like your web site to be added to Nurmix Web Central's Atari LINKS page, please send me an e-mail and I'll check out your page, and add it to my LINKS page.

As a final note, the Atari pages of Nurmix Web Central utilize FRAMES. If your browser doesn't support them, or if you just plain _hate_ FRAMES, then turn them off, and non-FRAMES pages will automatically load.

Thanks for your time, and enjoy!

Does anybody know if there's any utilities that will allow you to read a 250MB 512/sec dos partition over scsi (250meg Zip drive) to get round the TTOS 32meg partition limit? I want to back up samples from my Korg Triton to my Atari scsi drive and be able to transfer *.WAV files between them.

Thanks,
Richard B.

This is possible with HDDRIVER. HDDRIVER supports an option for creating
media that are DOS and TOS compatible at the same time and don't need
any additional software to be accessed from TOS/DOS or Windows.
With MagiC, MiNT or Big-DOS and HDDRIVER you can additionally directly
access DOS compatible partitions > 32 MByte.

Yes, worked fine.

P> Also, is any of the software on this CD like special versions or
P> copyrighted stuff or is it basically just a collection of Mint
P> stuff that one can download from the Net?

The web-based administration tools and some of the ethernet drivers on
the CD are copyrighted, the rest is free.

Martin! do you know if the MiNTnet ethernet drivers that come with the
MiNT99 CD are capable of DHCP? These are copyrighted stuff and not
available for downloading AFAIK. I wonder if Mario is considering this
as he writes drivers for his Ethernet card?

However, on most

3353. need Atari 1040ST drives

Newsgroup: comp.sys.atari.st
Date: 1999-12-03 00:00:00 UTC
From: Joseph Zorzin <redoak@forestmeister.com>
Message-ID: <3847E338.15B38BC4@forestmeister.com>
Source record: 69536
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.programmer,comp.sys.atari.st

I need, preferably an ST hard drive, or at least an external floppy.

Until 1993 or so, I used a 1040St with an external floppy and a custom build hard drive. The hard drive died, and then I bought a Pentium.

But I programmed on ST and have a need to update some old software that I created back then.

So, I'm looking for a hard drive for the ST, either an ST hard drive or a custom built one. I'd also need whatever software it would take to get the hard drive working. I doubt that I could find whatever I used back then.

If I can't find a hard drive, I'll consider buying an external floppy. Shortly after my hard drive died, I continued to program using 2 floppies. But now I can't get that old external floppy to work. The light comes on and I can hear a hum, but it won't read any floppies. Might it be reparable, or maybe it just needs a good cleaning?

I've got Gemulator98 installed on my PC but so far I've had no luck in getting my Megamax Laser C to work with, even with the help of the author of Gemulator. The author of Gemulator says he uses Laser C on his PC but for me- it crashes Gemulator. Any advice on this issue?

Even if I can get Laser C working on Gemulator, I'll have another problem- getting my HP4p printer to think it's an ancient HP FX printer. HP sells an FX emulator for the 4p laserjet, but for $200!

Don't be so modest, most of us sit in the background, mumbling/grumbling about the efforts of others and doing bugger all ourselves. I've got no time for the poor bloody silent majority, when they wake up and find the (usually extremists) minority who have got up off their backsides, have the world by the balls. I'm not saying that OXO and WenSuite are the bee's knees, just that they should be given a chance. As for speed, I am lucky to have bought Joe Conner's Milan, and CAB 2.7 is very promising on that, the only limitation being in accessing the Milan's high speed ports, I'm limited to 19,200 at the moment. Do you know if OXO are thinking about Milan compatibility? They would be very silly not to. It is the way foreward.

Bob King.

>But I've already stated that the Atari is a much simpler machine, because it
>does a whole lot less. With complexity comes confusion. I don't see any
>way around that. It goes back to my calculator analogy. Very simple to
>use, but not much of a computer. (I'm not saying Ataris are not much of a
>computer -- they're just not as powerful as modern computers.)

The motivating principle behind Be is that Window's confusion comes more from the baggage of being a legacy system and having to preserve backward compatibility. I have sort of been watching Be (without doing anything, because, unlike Linux, you need a fairly modern intel box to run BeOS). Does anyone else out there have it? Use it? Develop in it? It seems to be quite complex, but (to listen to the "experts") not as confusing as Windows tends to be. How about the issue of the installation of new apps sprinkling new files all over, requiring a deinstaller to remove everything?

My take on the whole issue is there's no question in my mind that a Wintel is more capable than an Atari, entirely because, due to several factors (including evil Microsoft market tactics and Atari marketting stupidity) the Wintel is getting virtually ALL the attention of HW and SW developers, leaving virtually ALL other machines - Atari, Amiga, even Apple/Macintosh - to slowly strangle on a dwindling pool of dedicated fans. Of course it's better. It's the only thing being improved.

But I refuse to be "just like everyone else", and am willing to sacrifice some of the capability (how many HOME users need it, anyways?) the Wintel would give me to use a different AND FUN platform like the Atari.

Uncle Bill has worked hard to be the only game in town. It isn't all that bad for the average uneducated (in the ways of computers) home user. Go out buy a box / monitor / keyboard /mouse ect and away you go. Often the OS and apps are preloaded so the hardest things to do are find the shortcuts and having your ISP guide you through the wizard to set your Internet accounts. Things these days are real easy for the couch potato. All of the software caters to Bill and the gang so finding apps is no biggie. No need to worry that the prog you want is unavailable for your system. The biggest worry is if your system is powerful enough since it is only 3 mos old and becoming obsolete. :o)
No need to worry if a PC is better than an Apple or an Amiga or an Atari. Just buy the Wintel system of your dreams and GO. Amazing how Steve Jobs may change that again. Maybe the Wintel conspiracy IS susceptible to the likes of AMD and Apple not to mention Linex.
NT is working hard to kill Novel due to all of the compatibility M$ is adding to NT4 in order to crack that market. Once in the story will be the same. Genocide. Anything non M$ must die.
With all of the current inroads being made against the Wintel boys there might have been a chance for Atari to strike had capital been available and new competitive hardware been available. Would a current PC clone by Atari been able to raise some capital or at least raise the opinion of Atari in the marketplace enough that they could have been able to have a second wind with a modern ST line?

Steve

Hello,

I am having troubling printing out documents.
There is an overlap or part of the previous page
on the following page. At the moment the only way
to get around the problem is to print each page
individually. I have removed all desk accessories
and auto folder programs other that GDOS. The GDOS
version I am using is 1.1. My system is a TT.
Any suggestions on a fix, it's a real pain.

Thanks

You missed my point (or I badly expressed myself), anyway:

The idea was that 90% of the pc people use/own are only used for 2 tasks,
which are not even using a tenth of the hardware they have.
When I see a pc with more than word97 (office whatever) and AOL,
something out of the ordinary (like winzip in my example), that's a
"power user".

I can understand that.
However, when I see someone on the street overweight eating donuts, I
ain't gonna say anything, that's their choice.
When I know that some of my friends watch wrestling on tv, whatever dude,
they do as they please, I am not gonna try to convince them.
WHat about religion? and all, I certainly don't try to convince anyone to
another religion, or no religion at all.

Now I probably don't care about all that coz that doesn't have any impact
on my way of living.

I would make some effort to demonstrate magic/singletos users how MiNT can
be more appropriate in many situation. Because this more or less directly

has an impact in my world. (diverging development, standards already established getting messed up etc).

Some people are not meant for another OS, (could be because of hardare insufficiencies, or lack of need or patience). I don't even try to talk to them, I just show them the doors of MagiC for their own good when they are not satisfied with what they've got.
Anyway.

```
-----------------------------------------
/
MiNT Is Now TOS, let's move on, shall we? /

"When the time comes, I will know and I shall be." Q-Funk

It is really too bad that an ISP feels they should be able to charge a hefty
"surcharge" for a static IP. When you consider the actual number of
customers that require one vs.. the address pool they have and the number of
users that their hardware will allow online at anyone time there shouldn't
be a problem. You really are just paying a setup fee mind you an ongoing
one.

Steve

I imagine the surcharge for the static ip is partly to defend against
cablemodem/dsl customers from using their highspeed connections as a
server. The isps have to pay for their bandwidth like everyone else and
you got to admit their are alot of people who would use the static and
high speed for more than playin' quakeIII.

Source record: 69347

Hey all.. I've got a little problem with my new copy of MagiC 6.01...
and before someone shouts, "Upgrade to 6.1!", I'm trying.. :) Besides
that, I doubt they would have shipped 6.01 with such an odd bug..

The scene:

* my stock Falcon030. (Well, almost stock--it's had the buffer fix
applied to it.)
* ICD 6.5.5, CENTScreen, NVDI 2.5 & MagiC 6.01

I get Error #-69 (68000 exception) whenever I try to do the following..

* launch Taskbar (either the beta or the last final release)
* hit "Options..." in the Format Disk dialog
* hit any of the buttons in the lower-half of the MagiC Config window

Is there some call that all of these operations make that's causing
this error?

I've tried doing these things with and without MagtoROM w/MagXBO32,
NVDI 2.5 and CENTScreen. I'm hoping ICD doesn't have to go..!

Can anyone help me out here?

Cheers,
Derek

Hello!

>Why hating TAR/GZIP? It's easy to use.

Because every version I could get my hands on hasn't worked for me. If someone could explain better than the doc's how to use it, maybe I'll be a little less frustrated with it. But for now, it is completely unusable for me. When decoding most files, it either crashes immediately upon running, or it crashes partway through the decoding process, getting only a small part of the archive. This is why I hate it. It isn't easy to use, at least from my end.

>Anyway if you still want MiNTnet 1.04 I can e-mail you the package in LZH >format. Let me know.

Yes, please! Thank you very much! Without that I am completely stuck.

Demzy,

I have one of those Mega keyboard couplers left in stock (new). It is a double ended female-female connector to connect your existing cable to another cable. I'm out of the extension cables but you should be able to find one elsewhere. The price for the keyboard connector, including US Priority Mail shipping, is $5. Reply in Email if interested.

I agree. Making programs available which only run under Magic won't
persuade me to buy Magic, nor can I buy and use the programs.

In my case, the above is null, because Quicknet subscribers run behind a firewall that only allows port 22 (ssh) and 113 (ident) for incoming connections. This is plenty enough for teleworkers since ssh cane be used to create IP tunnels.

Anyhow, Quicknet's contract specificly states that "a subscriber cannot, under any circumstances, use its cable-modem to provide commercial services such as BBS, FTP archive or web server."

I think that's probably a lot more than just "partly" the reason.

-Online Today - April 1987

I tested the 800, 810, touch tablet, some cartridges, some disks.
I did not test the printer, modem, cassette, computer eyes. I therefore can not report on the operation of all items. But what I tested worked great (and so I got too involved and spent too much time playing some classic old games)
There are no joysticks included, which may be required for some games. I had put them all into another auction. If the buyer of that auction doesn't follow through on the deal, I will include 2 untested Atari joysticks.)

Buyer is to pay shipping, estimated at $30. Thank you!

Heh! Interesting to hear, but *how* a libsock.slb kan "kill" MiNT-Net is
beyond me... Anyway, this slb should be perfectly usable under MiNT as
well - if ASH ever release the specs on the IConnect API that is.

> High End Webbrowser in the works? (Dec 4)

Now *that's* interesting! I just wonder how ASH can justify making it
MagiC-only now that FreeMiNT and N.AES 2 supports everything MagiC does
and then some.

Whoever you're quoting this from is a complete idiot.

MiNT-Net can readily use most BSD/Linux/Unix sources out there,
with almost no patching required, since LIB 0.54. Somehow, I'd
really doubt that iConnect will ever provide this immediate way
of porting outside material.

If you look carefully, you'll notice your phone connector _is_
of the 6-conductor type, but only the middle 4 wires are used.

Anyhow, to make a quick cable, use an ordinary phone cord, but
clip one end off and reverse the connections.

If you are handy with soldering iron and some other tools, you could try my little project 'Monitor Master Plus'. Email me for the archive, if you like. It may have found its way to an ftp site by now. You will need to locate an old Monitor Master - there are a couple of new ones available locally for pretty cheap here in Boise.

"When the time comes, I will know and I shall be." Q-Funk

This is just pure greed. The only reason I can account for this is
additional customers they feel they can support with your static IP. If
they have those of you with static IP's pay extra they don't have to new
customers or buy extra hardware to support those customers.

RFC 2131: Dynamic Host Configuration Protocol

Basically, this fetches a dynamic IP at connection time, along
with the gateway and netmask IP. It might also use your Ethernet
card's MAC address (its serial number, sort-of) as means of
authenticating you.

Martin-Eric Racine The Atari Stacy and TT030 Homepage
Lappeenranta, Finland http://members.tripod.com/~TT030/

"When the time comes, I will know and I shall be." Q-Funk

I am unsure what you mean by using your MAC address to authenticate you. I understand the concept of MAC addresses being bound to protocols such as the TCP/IP protocol suite but just want you to clarify exactly what kind of authentication you are talking about.

>
>Does someone know the Atari model number of the original keyboard?
>There's a round, female 5 pin DIN keyboard connector on the back of the
>computer. Will other PC keyboards work?

They should but... if your Atari is an XT clone (ie 8088 or 8086) you need a keyboard that has a selectable setting (switch at the bottom usually) or a keyboard from an XT (or clone). AT only keyboards (286+) won't work on an XT (or clone).
They are electronically different, it's not just a case of different wiring configuration on the plug.

>
>Was there a special Atari version of DOS or should any MS-DOS boot disk
work?

Yes, any version of MS-DOS will work.

BTW, both Atari and Commodore made PC clones. I'm not sure about Atari, but the earlier Commodore PC clones where designed and built by C=. Later, C= simply rebadged clones from other manufacturers.
The PC-5, PC-10, PC-20 and PC-30 range of C= PC clones sold in huge numbers in Europe, especially Germany.

Bit of useless information, but anyway...

Pentium PC's manufactured in Holland by Tulip computers where branded and sold as Commodore PC's up until recently. Tulip owned (owns?) the C= logo and rights to the old 8 bit C= line, but has since gone bust.

Neither Atari or Commodore PC clones are rare (or worth anything ;-) except curiosity value ofcourse.

Regards,

Clockmeister.

Hi Alyre:

Because I do Prof. Music Publishing of Guitar Scores I am quite
familiar with DTP on Atari. Time Works which is about 6 disks, is
the worse program I have ever used. It is slow, not stable and its
printing just does not work.

I find that Calamus 1.09n is a great program, it is fast , stable
and prints a very complex page in about one minute!

I also like PGS (PageStream), it is very stable on my falcon and it
has many many features but to realize it you must study the manual.

Use ST to disk.

If you want more software for your STs.

Try

http://www.umich.edu/~archive/atari

Large selection of software and networkable games, since you have 4 STs.

Btw Warez aren't as good as originals. Usually hacked games that are
incomplete and you don't find this out until you are well into them.

Lots of Atari software is available second hand. There are still dealers
with Atari software for sale.

There are lots of gadgets to get for your STs and fun hardware hacks.

There is definitely no need to be bored.

>
><< Neil >>

Actually we are in agreement here. My information is on a ten year old
memory. I remember it was 1989 when they announced 1 millon units. The
problem with the STart article is that it relys on Sam Tramiel for its
information ;-P. The lag time for start was roughly 3 months.

But really these numbers are strong, for while the ST was fizzling out in
the USA and Canada there was enough strength in Europe to continue
development until, well, until it decides to stop completely.

Hello!

First, let me just say that I absolutely hate the TAR/GZIP crap that Mint and other Unix systems use. Anyway, I have a satisfactory Mint/GUI setup. Now I want to experiment with MintNet. The problem is I cannot extract the files from their TAR/GZIP archive. Every decompression program I've tried has either crashed while decompressing or only decompress a very small part of the archives I've downloaded. I'd like to know if someone could please E-mail or put on an FTP site MintNet 1.04 in LZH or ZIP (NOT GZIP!) format? These are much better for me as I'm very familiar with them and I know they should actually work. Thanks!

O > least in marketing) than Uncle Jack?

Mr. Gates was astoundingly, amazingly, terrifically slow at it,
too... for a genius :-). Almost makes one think that Xerox, Apple,
DRI, and all the rest might have had just a little more on the ball
than he does. Of course, he was fairly fast on the draw when it came
to publicly trashing his competition while he was hijacking their
ideas behind the scenes. But that's just all part of being a
visionary, I guess.

I agree totally. Installers give me the heebie-jeebies (make me very
nervous).

I have seen the 'wizards' on my wife's borrowed Windoze box. A truly
ugly sight, given my prejudices. They tend to ask truly bizarre
arcane questions, if you don't know what they are asking for. Which
kind of defeats the purpose, don't you think. But they worked okay.
Maybe I should change my attitude. Guessing games can be fun :-)

Short of changing software, I think you may inadvertantly set the wrong page size. The only other time I had problems was when printing to PS which isn't as close to WYSIWG with timeworks as is its GDOS.

If you have been able to print properly in the past and haven't changed printers, I suggest you look at your initial setup.

And while I have both Calamus and PStream, the simiplicity of timeworks makes it very user friendly. It is not meant to be a powerful dtp. If only its GDOS printing was more effective on the Atari Laser.

Hope this Helps.

Because one guy -who's native language is French- dislike OXO you stops
the translations of your products? To me this seems not a very good
decision. I know lots of people are waiting to see the English version of
Expresso or even XXL. I must say for the moment I still prefer CAB because
I can use it with MiNT-net or with STiNG, which I can't do with WS.
IMHO the TCP/IP you use is the weak point of the whole concept. It seems
lots of people have a hard time to get connected. Most of then even can't
make an connection at all.
This is the only reason why I don't buy WS. From the moment on I can use
WS with one of these TCP/IP stack I'll buy WS. I think this is the opinion
of lots of other people too.

Yep, the graphic card is the setting you must use. But remember you must
save it (save INF) and then quite/restart WS.

Oh yes, you can. For instance with Diskus, however not with the latest
version of Diskus (3.71). With v2.53 you can give the nameless dir a name,
making it so deletable.

I normaly don't use the copy back cache but just like you I'm using
MiNT/N_AES. Sometimes resizing the mean window is enough to prevoke a
crash. Processing images is not faster then with Cab at least not when the
pictures aren't in the cache. Once in the cache Adamas is much faster then
Cab 2.7 but slower then Wensuite which is really extremely fast.

Yes 15 bit and 32 bit doesn't work. I haven't read the docs but I remember
me that OXO said once that 15 bit and 32 bit aren't supported.
I don't know why Jo Even can't save his setting but I certainly can do
this.

The problem is/was that it wasn't possible to save the configuration. A
file was indeed saved, but apparently not read or evaluated by Wen.Suite
(yes, I restarted it) because all the options were back to default.

>>I noticed this, and I'm unable to delete it :-(

OK, but I don't want to invest in a piece of commercial software just to
clean up the mess from another commercial application... Or can the Diskus
demo do this?

Actually, on my system Adamas doesn't seem to use any cache at all.

Simple answer for you John. When you find the 19 pin cable, (Check out
comp.sys.atari.tech there is a similar thread on this cable, you will need
to connect the one end into your MegaST and the other end into the IN port.

The out port is required should you get ahold of another drive and wish to
daisy chain it.

For software you can check the various Ftp sites for ADHI versions.

Hi,

I want to offer a SPDIF Interface for the Falcon 030. It is compatible with cubase Audio has optical and koaxial I/O and can be used as a backup system as well as recordind sound from or to a DAT Tape. You can also use the DAT engins A/D Converter wich might be better than the falcon ones. Over that I have a lot of Software 1st Base, NVDI, or Calamus.

It's a 19-pin straight through connector. Keep it as short as you can.
>There are two
> ports on the Megafile (one marked 'harddisk in' the other 'harddisk out').
> The ST has only one connection for a harddrive so I'm starting off
confused!

The OUT is just a through connection for chaining to other devices which use
the ST DMA (Hard Disc) port - such as the Atari laser printer.

> I guess I'll need the right software also (hopeing i have already).

Yes, you will probably find it on the HD. If not just grab a copy of AHDI or
something similar. You don't need sophisticatd drivers for the Megafile.

3421. MagiC News(MagiC 7, New Webbrowser, MM 6.1.4)

Newsgroup: comp.sys.atari.st
Date: 1999-12-04 00:00:00 UTC
From: Bengy Collins <collins@bulli.com>
Message-ID: <B46E8A50.7AD%collins@bulli.com>
Source record: 69494

MagiC 7 network support! (Dec 4)

A very reliable contact of MagiC online has informed us of some very interesting "rumors". The first one? It is a strong possibility that MagiC version 7 will have built-in networking support and that a TCP/IP shared lib. is now in final beta. Below you will find an agreeable quote from the informant:
"Can you imagine MagiC with a built in IConnect compatible stack, and shared libraries that makes writing clients very easy? :-))))..... this means the end for MiNT/freeMinT/N-AES and other crap."

High End Webbrowser in the works? (Dec 4)

It's has been speculated for awhile now that ASH is working on a "CAB-Replacement" web browser that is to be fast and boast many modern features. Recently, some information has came out that suggests that this is exactly what ASH is doing, as they need to put a "browser in their catalog ASAP."
The interesting aspect is that these recent rumors say that BOTH the Brothers Behne (NVDI) and the two K's (MagiC) are working together on this product! This is really something to watch out for.

MagiCMac now friends with OS 9! (Dec 3)

Finally, ASH has released a patch to update MagiC Mac 6.x to a state of OS 9 compatibility. Previously, OS 9 would only work together with MagiC Mac if they were ran on older Macintoshes that had the ROM hard coded. (this excluded every recent Macintosh, including the original and current iMacs/G4's)
The update is free of charge and can be downloaded from the link below.

http://www.application-systems.de/magicmac/download.html

Hi Group,

Just got a vintage Atari Mega4 ST ! What I need to get it running
is a cable to hook up my Nec 3d Multisync monitor. Apparently it needs
some kind of special switch or cable.
Also, I want to add a hard drive, modem, and CD-rom. Any
suggestion
of which models/brands/size/speed etc. that I should get??? Any to shy
away from ??? Thanks for ideas.....

Yes, you have to select "graphics card" in the video settings and
restart WenSuite.

>
> > As for the GUI, well I've seen worse. All of the setup options are

On my stock Falcon with NVDI the font selector works just fine. Same on
the PC with Gemulator and TOS 2.06. Like most apps, it starts with the
default system font, which is at the top of the list. I don't understand
your comments.

Well this is what is in the FAQ that comes with WS3.30:

*Q: On my computer (Magic PC, Magic Mac in particular) display of images
in 65000
colours is correct, but is completely garbled in 256 colours.

R: In all cases when display is not on an original Atari (on a PC issued
video card), you
should go to the menu Options>Display>Graphics and select Graphic Card:
ISA/PCI.
After this, save the options (menu Options>Sauve INF), quit WS and
relaunch it (the
graphic mode is only initialized on startup).

*Q: I cannot get a good display in 32000 colours.

R: The 16 bit graphic mode (65000 colours) is prefereable to the 15 bit
(32000 colours)
mode. Since all add-on video boards allow both of these modes, use the
65000 colour
mode for a good display.
These are the graphic modes supported by WS:
-monochrome: YES
-4 colours: Supported as monochrome (real 4 colour mode is in the works)
-16 colours: OK (not tested on PC video boards)
-256 colours: OK (all boards: shifter ou packbits modes)

-32000 colours: NO, switch to 65000 colours
-65000 colours: YES (tall boards: Motorola or Intel RRRRRGGGGGGBBBBB
modes)
-16M (24 bits): Runs on some graphic boards
-16M (32 bits): Runs on some graphic boards

> Have people tested (online) the usenet and email stuff???

Yes. It connects first time. Usenet and email is not very fast, but it's
comparable to newsie as far as I can tell. It doesn't have the options
of Okami.

> Most of the people just try offline working with the browser. Not all

Again, from the FAQ included in the latest package (an previous ones,
albeit in french):

*Q: On my computer (Magic PC, Magic Mac in particular) display of images
in 65000
colours is correct, but is completely garbled in 256 colours.

R: In all cases when display is not on an original Atari (on a PC issued
video card), you
should go to the menu Options>Display>Graphics and select Graphic Card:
ISA/PCI.
After this, save the options (menu Options>Sauve INF), quit WS and
relaunch it (the
graphic mode is only initialized on startup).

*Q: I cannot get a good display in 32000 colours.

R: The 16 bit graphic mode (65000 colours) is prefereable to the 15 bit
(32000 colours)
mode. Since all add-on video boards allow both of these modes, use the
65000 colour
mode for a good display.
These are the graphic modes supported by WS:
-monochrome: YES
-4 colours: Supported as monochrome (real 4 colour mode is in the works)
-16 colours: OK (not tested on PC video boards)
-256 colours: OK (all boards: shifter ou packbits modes)

-32000 colours: NO, switch to 65000 colours
-65000 colours: YES (tall boards: Motorola or Intel RRRRRGGGGGBBBBB
modes)
-16M (24 bits): Runs on some graphic boards
-16M (32 bits): Runs on some graphic boards

Nope, this can't be done AFAIK. A serial mouse is ok though, either
directly on the ST's serial port with a special driver (but then no
games, and no modem), or through Mario Becroft's adapter.

Details in the Quick FAQ.

>title "power user".
To put it in Katherine's words: they have moved on...:-)
Instead of a "MagiC Power User" one is now a "ASH Power User". In most
cases the "Power User" price is between 10 to 15% lower... just enough
to cover the extra cost of shipping..

Cheers from Belgium
Dennis

From: OXO Systems <oxo.systems@online.fr>
Date: Sat, 04 Dec 1999 08:07:34 GMT

Hi Fabrice,

>Wensuite III is the third software of the WS family, then
>Wensuite 3.30b is the 1.30b version of WSIII: Goob job,
>we think.
You do, do you?
Well I think different... as long as WenSuite III is a demo or beta, we have no reason to complain, however since you actually sell it for real money, this puts WenSuite III in another class.
As commercial software this package is *not acceptable*, simply because it is far from finished. What you basically are doing is to ask people to pay for a program that is still in beta phase. And then you complain that these customers don't like the situation... Using the demo there's no way one can find out if WenSuite does what is promised. It's like selling a house and forget to "mention" that there's no roof (yet). In my book this is misleading the public, willingly and knowingly. Can misleaded customers get their money back? if not then Jo is right.... cheating & stealing :-(

>But, I think that this english version of WS will be the only
>english version of any Oxo's softwares, because we have no
>time to spend with someone like this "Mister Jo". We have
>no plan to fight against persons who dislike us, or our
>softwares. If You prefer CAB, or other, stay with them.
Now this is talking.... let's use some blackmail!!
IIRC you've done the same thing in the French newsgroup six months ago, OXO got quite some heavy bashing and announced the same thing, then some fans started pleading not to leave the Atari platform...blablabla and gracefully you tempered your horses..
So what do you expect us to do? condemn Jo? Allelujah, praise OXO Systems and their marvellous programs ? start crying out loud ? beg you to please please change your mind?

Sorry, but you wont get none of this coming from me...
Nobody here is really interested in the beef you've got with Jo, for the time being Jo his predictions are still true. The best way to prove Jo wrong is to start working like crazy and improve WenSuite III like hell.

>It seems that, for Jo Vandeweghe, our softwares being some
>shit ?? Don't forget that if he can't use them (for differents
>reasons, like his mediocrity), hundreds of french users are
>satisfied.
No, Shit is not the right expression, unfinished crap is the one.
Jo has been around a long time, everyone has faults and shortcomings, but

calling him midiocre? My personal experiences with Jo are very positive,
and I'm convinced a lot of people in this group will say the same.
I'm sure that there are hundreds of satisfied French Users, but the last
year I've read tens, no hundreds of postings in the French group of users
who were not satisfied... I suppose you're unaware of this?
Since you obviously read Jo's posting you must have read the others as
well, are these people morons? stupid? retarted perhaps? Why is it for a
software developer so difficult to admit that there *are* problems with
his project? In the long end I'm convinced that you would get much more
positive input, then when plainly denying it and blaming others.

> If You prefer CAB, or other, stay with them.
Aha, finally.... the bottom line..
Unlike with WenSuite one can actually access the internet using four
different stacks. CAB works in all color resolutions and supports all the
graphic cards on the Atari platform. CAB can display more then just one
single animated GIF at once. CAB runs on all OS. CAB can print. CAB may
be slower in displaying pics, but at least these are shown correctly. CAB
lets me edit the cache. CAB displays progressive JPG's. CAB is an OLGA
server/client..... must I go on?
Here's something else to chew on: Alexander Claus and ASH have *NEVER*
released a single version of CAB that didn't fullfill the promises made and
behaved as advertised. Where do you get the nerves to compare WenSuite with
CAB? Everyone here knows that I'm not a fan of Alexander Claus but compared
with him the entire OXO team is a bunch of little boys, and behaving like
it as well.
You want our support? deliver the goods, as long as you don't I'll stick
to CAB and Mister Jo, unlike OXO these two haven't let me down yet.

Cheers from La Belgique
Dennis (unsatisfied WenSuite User)

Hi Terry,

> Not sure why you'd compare Atari's to the NT, anyway, as the NT was
>never meant to be a consumer OS. User friendliness is not nearly as
>important in the corporate world, where professional installations and
>upkeep is the norm. Of course, W2K is starting to change that anyway.
I think that the corporate world using Mac's is ROTFL with the above
statement...
BTW: I have never said that installing hardware/software is user
friendly on a Atari. Fifteen years ago that word didn't even exist. I
said that compared with a PC running WIN whatever it's easy and user
friendly. Why shouldn't I compare a Atari with a PC running NT4?

>First, why would I not have an OS installed? And second, how are you
>booting your Atari without an OS installed?
Because every Atari comes with the OS build in. If you want to compare
setting up a system from scratch, then it seems logical to me that you
have to install the OS first on the PC.

>I can boot Partition Magic from a floppy, if that's what you mean. I
>can then split, merge, and create new partitions without losing ANY
>data. I can make them FAT16, FAT32, NTFS or Linux partitions, and mix
>and match as I please. If I decide later that I want to change the
>partition type, it's very easy to change them, again with no loss of
>data. If I don't like the size of my partitions, again, I can change
>the sizes with no loss of data. Need another partition? Okay, no
>problem...no loss of data. Too many partitions? Okay, let's get rid
>of one. Again, no loss of data.
No this is not what I ment, as long as there is no OS installed, you
wont get far booting that disk.
I am aware of Partition Magic, it's not new, it's around for over two
years now. Some users are wild about it, but some can tell you horror
stories.... this has nothing to do with the topic, Partition Magic is a
commercial program, it's not part of the OS.

>Not sure why I'd want all that stuff connected, but if you're' trying
>to say some things are easier on an Atari, I don't dispute that. The
>setup you described is far from typical, though, and you're still very
>limited in the software you can use. For Joe Average wanting to add a
>new peripheral to his computer, I still maintain it's generally much
>easier on a PC.
Yes, that's what I was trying to say. No one uses all that stuff, but
suppose that somewhere one would like to do it... he can. Adding the

same stuff to a PC will be difficult.... not enough expansion slots.
And you did dispute it, that's why I given the example.

>I'm not trying to prove anything, nor am I trying to convert anyone.
>I'm simply offering a different perspective. Is this group only for
>those who belong to the Atari cult, where opinions not 100% pro Atari
>are not welcome?
This group is not a cult group to start with, we don't belong in a
museum (yet) although I realise that some people think so ;-).
I think that some 40% of the regular posters in this newsgroup are
using a PC or Mac. But the difference is that these people are still
using Atari software, emulated yes, but they still are Atarians. In
your case it's different. You're a 100% PC user, telling us how much
more advanced and powerfull your setup is , we are all aware of this.
I think that the people here are rather tolerant, a Mac user praising
his system in a PC newsgroup, would be flamed to hell and back.

Offering us a different perspective is very noble, but you're not the
only one trying to do this. Every single day I'm brainwashed by
advertisements, collegues, friends and relatives trying to win me
over.... it's the same tactic the Church has used for centuries. And I
don't want to be part of it...
I bought my first ST way back in 1985, the choices to make today remain
the same : Mac or PC. TBH in 1985 I was more attracted to the Mac, but
that computer costed more then an average car, so it became an ST. I
never regretted my choice, the last couple of years I enjoy computing
the Atari way even more. In 2000 I'll be a Atari user for 20 years.
That's half a lifetime. I loved using the Atari 400, 600XL, 800XL, ST
and TT every bit of the way, Atari doesn't build machines anymore, but
the spirit lives on, if the Milan II isn't vapourware, that will be the
machine that I'll be using the next decade. And yes, I know this machine
is outdated even before it's released. But it's good enough for me...
Offering me another perspective is of no use, I made my choice. I find
it even rather insulting.... what makes you think I'm not able to make
decisions myself.
This newsgroup is one of the places where PC users leave me in peace.
You're opinion is valued here, just like all others.
I disagree with it, but I respect it.... is asking the same thing too
much?

Cheers from Belgium
Dennis

Hi Terry,

>>Can you send/receive email, ftp, telnet, ICQ ..faster then I do? a
>>56K modem remains the same thing when it's connected to a PC.
>
>Well, yes, I can. I'm using a cable modem. Let's see you do 512K on
>an Atari.
Bravo!! that is really an unexpected answer. But the question still
stands. Can a PC do it faster using the same connection...?
BTW: 512K is chicken shit. Using a ASTRA satellite link connection will
give you mimimal guaranteed speeds of 2MB...

>I probably can type faster, because I'm using a real keyboard (and can
>easily swap it out if I find one even better).
I never said that I was using a 520 or 1040 keyboard...

>I may not be able to actually burn a CD faster, but I guarantee you I
>have a lot more options available to me about what to put on that CD.
You guarantee ? Give me a couple of examples please. I really would
love to hear what you can put on a CD, that I can't...

PS: So far you haven't proven that using a PC for internet clients,
wordprocessing or any applications needing a lot of user input has any
advantages...

Cheers from Belgium
Dennis

yes, modem switchboxes do exist! in fact, when I recently got ahold of
my SVGA switchbox to go between the Falcon and the Quadra, I saw some
modem switchboxes.

Needï¿½s a RS232 switch box. Works fine.
But evry time only one machine can access the modem.
Switching while online disconnect connection imeditaly.

Considering the PC is probably faster and is probably better equipped to
handle the larger speeds, yes.

>BTW: 512K is chicken shit. Using a ASTRA satellite link connection will
>give you mimimal guaranteed speeds of 2MB...

My cable company offers a 1.5MB/1.5MB service. My PC doesn't limit me to
512k. My wallet does. :^)

>You guarantee ? Give me a couple of examples please. I really would
>love to hear what you can put on a CD, that I can't...

I was speaking more towards the software available for creating and editing
CDs. Your Atari software may be very good, but there are a lot more options
out there for PCs.

>PS: So far you haven't proven that using a PC for internet clients,
>wordprocessing or any applications needing a lot of user input has any

Well you can, but I just don't think it's germane to a thread comparing the user-friendliness of PCs to that of Ataris. I've never used NT4, so if you want to say Atari is more user-friendly, I certainly won't dispute that. I might dispute the logic of the comparison, considering one's a corporate OS and one is a consumer OS. Now if you want to say Atari is more user-friendly than NT4's successor, I would disagree there.

>Because every Atari comes with the OS build in. If you want to compare
>setting up a system from scratch, then it seems logical to me that you
>have to install the OS first on the PC.

Virtually every PC comes with the OS already installed. It also comes with the OS on a bootable CD and you can easily create bootable floppies. Does the average consumer care whether or not it's in ROM? Well, yeah, he probably does care that he can easily update his OS for free right on the Internet. But I doubt if he cares otherwise.

>No this is not what I ment, as long as there is no OS installed, you
>wont get far booting that disk.

But when you create the disk, it installs the OS for you. So I'm really not sure what point you're trying to make. If you had a PC with no OS installed on the hard drive and no bootable floppies or CDs, then yeah, I guess you couldn't use it. I can't imagine why anyone would find themselves in that situation, though, so I'm really not sure why that's an issue.

>Offering us a different perspective is very noble, but you're not the
>only one trying to do this.

Nobility has nothing to do with it. I'm here because I enjoy the discussion, not because of some altruistic reasons.

>This newsgroup is one of the places where PC users leave me in peace.

Let's say you have ~200 fonts like I do, and want to use the Tahoma-font
(no. 180-something) for headings. It takes 20 seconds or so to scroll down
to this font, and you'll have to do this four times... Then do the same
for the body-font (Swiss) and non-proportional font and you'll get very,
very bored... A simple scrollbar would help a lot.

Now as far as windows being a consumer OS and NT being corporate there is nothing farther from the truth. The main difference between Windows and NT is security. Now as far as the successor to NT I assume you are talking about Win2000 which is an unfinished work and is buggy as hell at the moment so it can't be considered user friendly when it doesn't even work properly. Considering the resources available to M$ compared to Atari we should have the thing so user friendly it would do absolutely everything for us including make my breakfast and brush my teeth. Instead we have Blue Screens of Death, "plug and pray", peripherals that need additional drivers to work with DOS and a case before the US Dept of Justice. Now couldn't all of those resources make me a cup of cocoa? #:o)

Steve

Bob,

Have you tried plugging the modem into the other serial port on the back
of the Milan ?

One is an ST like port limited to 19,200 and the other is a "full-speed" port.
I had problems with getting the Sting dialer to find the modem on the fast
port but I had success when I opened the Milan and switched the short ribbon
cable from COM3 to COM4 (or was it the other way around?) so that the fast port
on the back of the machine was using the other COM port.

I then set the Milan serial driver to Com2 and it works fine at 57600 connected
to my 33600 modem.

Regards,
Peter

PS.

Does any know if the Milan Manual has been translated into English ?

Cross-posted to:
alt.games.video.classic,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,rec.games.video.atari,rec.games.video.classic

I have small quantities of the following Atari ST & TT monitors for sale. All units have been cleaned and detailed, and in good or better condition, but without boxes unless noted. These units were from a local Atari software developer who has now cleaned out their stored Atari items, so all are in great shape. If you have any questions in regards to unit condition, please feel free to ask.

All offers should be made in U.S. funds with the buyer paying shipping. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to Jim at classic.games@NOSPAM.telusplanet.net (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800, Colecovision, Intellivision, Classic Computer, Vectrex or Handheld games) sent to you, please specify system.

Hardware Please make an offer
==========
- Atari SC1224 Monitors 13" ST Color Monitor
- Atari PCT1426 Monitors 14" High Resolution TT/PC Color Monitor
- Viking 1280 x 960 20" Monochrome TT Monitors - In original boxes

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar and Jaguar CD Unit
- A working Vectrex controller
- A working DSS Satellite Receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

Last Updated December 5th
- Sold/Traded Items Removed

I have the following Atari 5200 items for sale or trade. All units are fully functional, cleaned and detailed, and in good or better condition. If you have any questions in regards to unit, box, or label condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to Jim at classic.games@NOSPAM.telusplanet.net (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800, Colecovision, Intellivision, Classic Computer, Vectrex or Handheld games) sent to you, please specify system.

This list covers the following Atari categories:
- Controllers
- Shrink-wrapped/New Games
- Multicarts
- Atari Force Comics

Controllers for Atari 5200 & Computer Units
==========
These controllers are intended to use the standard Atari plugs, and require an adapter to work on the 5200.
- 2x Suncom Tac Joysticks $10 for the pair
- 1x Spectravideo Joystick with suction cup base

** Atari 5200 Titles - New/Shrink-wrapped**
==========
- Ballblazer by Atari/Lucasfilm $20
- Pitfall by Activision $15
- Rescue on Fractalus by Atari/Lucasfilm $25
- River Raid by Activision $10
- Space Shuttle by Activision $12
- Zone Ranger by Activision $10

Multicart Cartridges
==========
- Atari 5200 Multicart $125 - Contains all of the released 5200 game titles as well as demos and the 5200 diagnostic cart. Game selection is done by

using DIP switches.

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Electronic Games Magazine memorabilia Please make an offer
==========
-Order Form Insert (Vectrex Version) - Mint Condition. This was the original full color order form insert that was packaged in with many companies cartridges to help promote sales of 'Electronic Games' magazine. It is a three page foldout which covers all the regular articles that 'Electronics Games' ran. The front cover is purple and offers Vectrex players a 44% discount.

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar and Jaguar CD Unit
- A working Vectrex controller
- A working DSS Satellite Receiver
- Working DSS H, HU or J Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

I dont think that, and I know the person who emailed me does not either. He
is simply a "pro-magic" user. It shouldn't piss you off, as I should
probably not have quoted that anyway, as it adds absolutely no further
information to the news of MagiC 7 networking. The "agreeable" part was
directed towards the first part of the quote. Can people not see the :-))))
in the message? it is not a serious quote. How could anyone say that mint
etc was crap. I don't think anyone even in this newsgroup has gone that far?

> I have also hear that the new Milan is impossible to buy with something
> else than MagiC installed. Is that a fact?

I am no spokesman for Milan so I cant say anything about that. I do know
that MagiC Milan will come with it. If you don't like MagiC, then you can
erase it and install something out. Right now you can only buy the milan
with naes.. so whats the different if its switched around?

> Things like this makes me seriously considering leaving the Atari world

Are you using it? I am. It's FAR more stable than Windows 98. Don't
believe me? Check out the beta groups. People are VERY enthusiastic about
RC2, and that's at least two versions away from the release version. It's
NOT buggy as hell, and many people (myself included) have moved from Win98
to W2K as their primary OS. W2K is already a hit and it hasn't even been
released.

I've never even seen the "Blue Screen of Death," though I've heard of it.
Haven't had the other problems you speak of, either. I am rooting for the
USDJ, though. YMMV.

Hi

Someone sent me a Hades B5 accessory some months ago. I tried it today but found a major problem in that various programs (CDBackup, Diamond Edge and Diamond Backup) all reported problems with the boot sectors of floppy and hard discs. Changed back to B4 and all seems to be OK at present. No permanent damage done that I can see.

Anyone else similar problems?

> couldn't use it. I can't imagine why anyone would find themselves in
that
> situation, though, so I'm really not sure why that's an issue.

Here's an example. Someone has a PC running Win95, bought pre-installed. Win 95 coaches him through creating a rescue disk, all well and good. Hard drive gets corrupted, tech support say the only thing to do is reinstall Windows. "Use the Windows boot disk which came with the machine", they say, except none came with it: just a CD and a manual. "OK, use the rescue disk and we'll use the format command on the hard drive if it's still readable". So he boots from the rescue disk and successfully formats the HD. Except now, he can't install the OS. Win95 CD isn't bootable, and PC doesn't support boot from CD anyway (many don't). To install it you need a boot floppy with a DOS CD-ROM driver on it, otherwise you can't see the CD to install from. Catch 22: Win95's rescue disk doesn't include the CD-ROM driver...

Far-fetched? Nope: this happened to me. Had to wait while the company sent me a boot disk before we could carry on. This problem is fixed with Win98, I'm told (rescue disk includes CD drivers), but judging from what I've read in the newsgroups this is not an uncommon problem.

On an Atari you are never without an OS: much safer!

It looked OK in Everest on my Atari, which CixRead uses for composing replies. However I believe that somewhere en-route to Cix there is a translation from the Atari to the PC locations of Umlauts. Certainly many German mails I receive have the PC-type Umlauts, which I usually change when printing out in Egale (which can do several subsitutions at once). Unfortunately I can't change the outgoing messages, although 'Conversion to ISO' is supposedly taking place (from a service message).

>That's a problem.... I love "Selectric", got it registered and used it

>drawback as we all know is the lacking long-filename support.

Yes, I like it too, but find I can't use it with CixRead because at times it seems to 'stick' and messages get written to the wrong topics at times :-(Occasionally, even on other programs it comes up with the wrong directory when I change to another drive - like if I was 3 levels down I suddenly find, say, 'I:///' in the path!

>Anyone know if there is any chance of an update? Is the author reachable
>at all via email?

No, according to Joe he has given up on the Atari. I believe that Boxkite is a suitable alternative that works with LFNs.

> I enjoy this about as much as I enjoy receiving HTML mail.
>
> I get two copies of a 3 word message in text and html.

Yes, I love that. Even when there is no logical reason for including _any_ HTML in the e-mail message. And don't forget the little .DSC files that tell you they were "automatically generated <blah blah>..."

And I love my PC-using friends that forward jokes to me. The actual joke is probably 3 lines of text, but with the HTML and DSC files, and the 30 or so lines of useless forwarding information and e-mail addresses of _everyone_ they sent the e-mail too, and the actual post itself being filled with ">" due to multiple reposting/quting by the previous M$ product users, the e-mail is about 10 times the size it should be in the first place!

Sigh...

>1) Microsoft is the devil:-).
>2) The users of MS products don't have a clue what their programs are
>doing.

EXACTLY RIGHT!! Everything is so automatic and "Wizard-ized" that they have no idea of all the drivel they're generating. And I guess it's all hidden to their friends who are also using M$ products.

And I've tried explaining the whole thing to my M$ PC using buddies, and they haven't the slightest idea what I'm talking about.

It is _exactly_ that. Sonera just sent all their home-ISDN and
dialup subscribers an offer to "upgrade to Quicknet and don't pay
any setup fee." Guess who's financing their "free setup" ...

<q-funk@funkyware.atari.org> wrote:

>Too bad. We could use that.

I didn't even think it was possible until I saw it discussed in one of the newsgroups recently. I've been messing with it the last couple days, changing my partitions around, merging, splitting and whatnot. It's a pretty awesome program.

It looks awesome, but it has some wierd side effects. I did a restore of a mail-server using a backup-software package and disaster recovery. After this Partition Magic will not recognize my partitions very good. I did make a test system and tryed what would happen, yep! data-loss....
I am a Falcon and Atari 8-bit user and I never have any problem. When I have partitions, I can still correct them using any dos...

Even my 8-bit Atari can do partition-swapping for booting up-to 96 partitions, it can even be done on-the-fly...
I can boot every DOS or BOOT disk from any partition I want.

Just dump your PC at home and never tell anybody you have some awesome software on PC. I will be very confusing for real ATARI users because PC is BIG business because of it setup. Standards are changing like SIMM 30Pins/72Pins/DIMM/S-RAM/ other systems... Why? Just to make BIG money. Also something like PLUG AND PRAY! (grr...) I disable it in my BIOS and what do I see when I start WINTENDO '98 YEP!! It will plug and play... Never have that problem on ATARI... I can go on for weeks with more... but I rather spend my valuable time on my ATARI and enjoy my free-time....

Gtx,
Rene

3477. Software (Demos/games) to demonstrate STE

Newsgroup: comp.sys.atari.st

3479. [FS] - UK: Floppy disks to buy or bin

Newsgroup: comp.sys.atari.st
Date: 1999-12-05 00:00:00 UTC
From: usenet@cyberstrider.net
Message-ID: <384a7f4e.11906587@news.cyberstrider.co.uk>
Source record: 69394

Guys

I have a load of floppy disks - DD and HD - which I have no use for now. I hardly ever need any Floppy Disks and if I do I just go out and pay over the odds for them.

As we are in the process of moving house within the next 10 days or so, these things are just cluttering up the garage and part of the house - and I have no inclination of taking them with me.

Anyone want these? Please tell me so before Wednesday this week or they go in to the tip.

At a guess there are around 400 or so disks - I dunno - I'll have to count them.

Anyone want them for £60 + Postage? Works out at around 15p each (based on 400 - and I am sure there are many many more).

Please get back to me soon...

Regards
Denesh

I have a keyboard like this, no internal sounds. I picked it up during the "$5 for all you can fit in a bag" phase of a school rummage sale, so I won't be heartbroken if I can't do anything with it. Besides this cheap (I think it probably came with one of those "teach yourself piano" bundles) keyboard, I have a 520 STFM and a 1040 STF, and a DIN cable to connect the keyboard to one of the ST's. All I want to do is play the keyboard and have the ST produce some noise. Any suggestions? A MOD sequencer would be awesome, but I won't get my hopes up.

Thanks,

- John

Hi guys !
Tried everything, mailed many persons but......the wonderful Wensuite won't connect me online !! What's the secret ?? Sting works, IConnect works, Stik worked, even an old demo of
Wensuite (don't know 2.60 version)worked..
But this PPP link WON'T !! Damn it, I can't stand this. So guys, if you know the trick if there's anybody out there with a NORMAL Atari (no Milan, Hades, Mac/ PC (with Magic) with an analog modem(telephone connection) , a guy who has also knowledge of Sting scripts, please react ! Or is it simply impossible ???
I'm very curious !

1stGuide will show just about any JPEG you throw at it and doesn't rely on any Falcon hardware. Works fine on everything from ST up, under TOS, MagiC and MagiC-PC and dithers to suit resolution. Only problem I have with it is it doesn't like long file names with spaces in them when passed to it on a command line or through AV-protocol (LFNs without spaces are fine).

It will also show loads of other graphics and text formats, plus play MPEG movies and some sound samples.

Is this not more to do with pricing policies for phone lines and how this impacts on use of the ISP's resources?

If you got a free or cheap fixed IP in the US combined with free phone connection there is nothing to deter you from hogging a connection all day and running a server, hence the odd (to me at least before I had a think about it) idea of a fixed IP for 12 hours a day. In Europe the cost of the phone call is the limiting factor, in that even with a fixed IP you wouldn't want to stay connected all the time unless you were rich and could afford a leased line anyway. So the fixed IP only affects the number of customers the ISP can handle with its address pool (as mentioned in another post) rather than risking someone hogging a connection 24/7.

As an example of the kind of thing I mean, Demon in the UK give you a fixed IP as standard for your UKP11.75/month, but had to move one of their original POPs from Hull, as that city had (due to a historical anomaly when the phones were nationalised initially) its own phone company which offered free local calls. At the time it could only handle a few connections at once and people were connecting for days at a time as it didn't cost them anything. The rest of the surrounding area couldn't get a connection as a result.

Just my two penn'orth.

Right, it's waste of money. Howver Okami is a offline reader for mail and
news. Popwatch is the thing that download/uploads your mails from/to your
mailbox. Newswatch does the same for news.
BTW: when you've a multitasking system you can use then both on the same
time. Can you do that with Newsie?

With a little bit of luck I can download my daily mails and news with in a
few minutes.

No it wouldn't cause any problems. It is actually handy for those users
with 14 and 15 inch monitors and even us 12 inch SC1224 users:-). It is
easy to not notice the length of your text if it is not preset at 72
columns when you are working in 800*600 or larger on a 17 inch monitor.

I don't believe we will be seeing this in NEWsie. It is never listed on the
suggested improvements, and I am certain it has been mentioned numerous
times. Anyways I am pretty certain it is not going to be on the next
release;-).

>And I love my PC-using friends that forward jokes to me. The actual joke is

Just thought I would add to the positive comments.

But I am too busy playing Doom right now:-).

I just happen to have a few drinks to slow down my reaction time and I
don't notice the screen refresh rates.

Actually playable. Excellent work.

As for games stay away from anything with crazy sounds called Astro
Panic:-). Runs on anything, but I still prefer the one found on Computes
Magazine disk. (LIAR:-).

Actually I have a few STe and MSTe demos that are on some CDs I have
aquired. Don't feel like sending them to the Belgian Ftp site as there
software selection is more modern.

I was uploading stuff to umich, until they change there ftp address earlier
this year.

That was a big mistake, the people at cash convertors are a bit crook;
and you could have
made cash for that stuff. All you had to do was post it in
aus.computers.amiga and it
would have sold within hours.

Your A600's would sell for at least $50 each, the A1200 possibly up to
$150 (likely more, it all depends on demand)

The genlock would also fetch at least $50..

Is there an archive anywhere on the web that has all those old graphics demos for the ST. Like from groups such as the Lost Boys, etc....

Also, is it possible to run these demos on a PC with an Atari emulator ?

Any advice appreciated.

marco789@lineone.net

Same here with EZ135's, no disk needed to boot up, and swapping
without any special software is permitted under TOS and MiNT.
Just stick it in with both AHDI and HD Driver.

M> I'm afraid his is talking about the Whileline CD series -The complete
M> Atari MiNT 1998- and not about the MiNT'98 distribution CD from Torsten
M> Lang and Bernd Ebert.

No, I am talking about the Mint98 from Thorsten Lang and Bernd Ebert -
that's the one I am running on my Milan. I don't know about the
Whiteline MiNT CD.

M> The MiNT '98 distribution CD however contains a very easy-to-install MiNT
M> package. I can recommend this CD. I've installed this CD on a TT030 in

Correct. And on this CD, the web-based admin stuff is not free, as
well as some of the Ethernet drivers (eg. the NE2000 driver). MiNT and
the basic distribution is free, of course, and I don't know about the
status of the installation tools. The authors should know more (and it
should be mentioned somewhere on the CD, but I don't have it here).

It depends on what you want to do with it. With MagiC, for example, DMA
background transfers are also possible with a Megafile drive. Since
these drives are so slow you profit quite a lot from the system not
blocking during transfers.

A disk must not be inserted. You can configure HDDRIVER to reserve
partition IDs so that if you insert a medium later you can access it
correctly. Please refer to the HDDRIVER manual for details.

There is no difference in this respect regarding the OS. When configured
appropriately the hard disk driver reserves partition IDs for media that
are inserted later and were not present when booting.

Hi Jo Even

>Heh! Interesting to hear, but *how* a libsock.slb kan "kill" MiNT-Net is
>beyond me... Anyway, this slb should be perfectly usable under MiNT as
>well - if ASH ever release the specs on the IConnect API that is.

Take a look at http://www.camelot.de/~zulu the website of Jï¿½rgen Koneczny, there's a hyp file there that explains the ins and outs of Sockets and IConnect...
Have you considered that MagiC might have network capabilities? Since it's going to be the standard MilanII OS, it would be quite stupid if it couldn't address the ethernet network card, wouldn't it.... if this is so, I bet you anything that network clients for MagiC will appear very quickly. And in the ASH tradition these will be easy to install and maintain...

>I just wonder how ASH can justify making it MagiC-only now that FreeMiNT
>and N.AES 2 supports everything MagiC does and then some.
It's not because NAES 2.0 and FreeMint have finally catched up with MagiC, that it's gonna stay like this. MagiC has not come to a stand still, and once again it will set new standards...
Perhaps that new browser is going to make full use of the new features of MagiC, and if it's going to be a high end browser it probably will make full use of the Milan II hardware as well. So it sounds logical to me that it will be a MagiC only browser...
What is more important is that Draconis which is supposed to come bundled with the Milan II, will not be able to deliver the goods... A new computer without a decent browser has no chance... and who knows, there might come a "light" version which is of benefit to all of us.

Cheers from Belgium
Dennis

Hi Martin-Eric

>Whoever you're quoting this from is a complete idiot.
>
>MiNT-Net can readily use most BSD/Linux/Unix sources out there,
>with almost no patching required, since LIB 0.54.
I've read this at least a hundred times before.... nice knowing, but why doesn't these BSD/Linux/Unix sources get ported over?
I have a cable connection here, network card and MintNet, unfortunately my ISP doesn't allow static IP's. So I'm still using this 56K modem. Is it so difficult to implement DHCP in those MintNet drivers? considering that the sources are there (quoting you)?

MagiC will be the standard OS in the Milan II which might come with a ethernet card supplied. Do you really think that the ASH guys are morons? I'm convinced that MagiC will be able to address that card, and knowing ASH I'm also convinced that it will support DHCP among many things...

And if MagiC will have a IConnect compatible TCP/IP SLB, what is so bad about that? it will make programming clients more easy while retaining compatibility with Emailer, Fiffi, Chatter, Teli, Ifusion and CAB... I suppose you would have liked to see them use STinG? dream on... the mentioned clients are among the best on our platform, why settle for less?

According to several reports SUSE is compiling the latest LINUX version, for the Milan II, if this is so, then the users of Mint/MintNet don't have to bother anymore, or wait until their hair fall out before one of those nice sources is ported over.... it will be there ready to use... where will this leave MintNet? in the trashcan ?

Cheers from Belgium
Dennis

Let'em fly 1.30 does this for all text input-fields... and I am sure there is a link for it in the Launchpad ;) ! Just hit ^C,^X or ^V (may not be activated by default). And I think Geneva is also capable of this.
Well that is not "anywhere" and there is no mouse selection but that is better than nothing.
Oh yeah and as the ROM GEM-Desktop is poorly written it does not work with it...

I'm waiting for this since Magic 2, I really hope to see something working
and make NOS support it..... why ? Read on!

c> High End Webbrowser in the works? (Dec 4)

Here it is! Can you think running MagiC with NOS running with all
client/servers and a browser in parallel ? This is what you can do now with
CAB, and you know the limitations, I need a way for users to have NOS running
while they can still use a "modern" browser.

Glad you brought that up. I have been in panic communication with
Jorgen Nyberg over accessing the high speed ports on the Milan 1, as he
is able to connect at 114k. I have down loaded the latest milan serial
CPX and the HSModem drivers for the HS ports, Jorgen has even sent me
his Sting SCR and CFG files and I have amended the Route TAB file as he
suggested. But try as I may I cannot get a peep out of the HS port
brought out to socket. It doesn't help that the various CPX's and Sting
bits each use a different set of names for the ports, eg some use
MODEM2, some MODEM 2, some SERIAL1, some SERIAL 1. Sting just does not
seem to be Milan aware.

Most of the people I have communicated with say that the new Milan
MSERIAL.CPX is not usable, I think it refers to, MODEM, SERIAL1,
SERIAL2, SERIAL3, SERIAL4, SERIAL5, SERIAL6. !!!!!!

CAB is very Milan compatible, but SOMETHING needs to be sorted out in
the comms field, and from what I have seen of Draconis, that is not the
answer.

Any help PLEASE (yes I'm shouting).

From OXO's latest missive, they have taken offence at all the flack from
certain parties on this news group and are doing a 'British Beef' on us.
Told you so !!!!!!!

Bob King.

Just about to e-mail you, when I saw from your last message you had a
Milan. Thank you, Thank you ..... I have little hair left anyway and
can not afford to tear much more out, so I cannot wait to get home and
try out your hint. Difficult to type with my fingers crossed!!!

See my plee, dated today, re the plethora of names used for the variuos
ports .... some uniformity please!!!! Any hints you can give for the
variuos settings for CFG, CSR, and other file files, please.

That`s right Dennis, it made my day interesting to. I can`t wait to see
MagiC with networks. I hope it meens that I can network my Falcon with the
Mac trough the LAN port?
As long as new software is coming out, we do not belong in a museum.
Even if I have to admit, it is not like 10 years ago, when there was a new
PD disk, with all kind of strange programs, almost every week.

BTW, when did you get emailer 2.3 ? I have not seen it anywhere?
I`m still using v. 2.0.

cheers

Joergen

Dennis, as you know from my postings on this topic, I have been in the 'give OXO a chance' camp and still say 'If you are genuinely hurt by Jo's remarks try to rise above them and develop for the English market, there are a lot of us out there'. However, for the first time in your very reasoned argument, you have mentioned a statistically verifiable point, the number of dissatisfied FRENCH users 'six months ago'. Certainly, about that time OXO's presence on the 'Net vanished. Can you give some more precise details, as my postings on the French news group don't go back that far. Perception is all part of the game of marketing a product and if it is perceived, however unfairly, that OXO are just 'trying it on again', then they will suffer.

I'll never forget checking some HTML on my brother's new PC and seeing Netscape crash, with Win95 acting strangely afterwards. Every time this particular page was loaded the same thing happened. Somewhat red-faced, I went back to my TT to investigate, thinking bad markup must be the cause. It ended up that one of the GIFs became corrupted during the floppy-based transfer. In no way did this corrupt GIF bring down CAB and MagiC like it did Netscape and Win95.

To be fair, though, this was using the first or second official build of Win95, and things have improved since then. Still, that episode will be forever ingrained in my memory -- first impressions are important.

The down side about running a Mac is that my bank doesn't support the platform: I can't do things online because their site uses VBScript. Sometimes you run into Microsoft's domination in strange ways. Although I have a disdain for the company, I use and enjoy Outlook Express and Explorer for Mac (not a zealot by any means).

Had I not seen some of the problems with Windows first-hand (including the dreaded "Blue Screen of Death"), I probably would have gone "that route". (My real intention was to get a Milan instead, but I simply couldn't wait for it to become available in Canada.)

But thanks to Calamus and a few other applications, my TT is still in regular use. Having been a Mac user for one year now, I must say that I can do almost everything just as well on my old machine -- it's just slower (but in some ways faster). It's to the point now where Mac OS is very much like my MagiC setup, but this took two commercial add-ons to accomplish: Action GoMac (like StartMeUp and Appline rolled into one) and Action Files (like Selectric).

My greatest fear about buying another computer was that my existing hardware and software wouldn't be used anymore. It's a decision one doesn't make lightly. In the end I have more of an appreciation for this machine sitting next to me. My foray into MagiCMac wasn't a good experience either: for me it just didn't have the feel and stability of the real thing.

Depending on your needs, your Falcon may become a doorstop. Some people make the transition without any need for their "old" Atari, while others hang on to aspects that keep them beholden to it. For many it's easy to

"move on" completely, but only for those who don't look upon Atari as a shrine of anti-Microsoft sentiment. There are Mac users who think this way, too: people who won't run Explorer (IMHO the best Mac browser) because it's a Microsoft product. The polar ice caps could be melting but they would still be more concerned about what Microsoft is up to.

Care to explain?

I'm not sure what that quote above is trying to say, but I've not told anyone their hardware is obsolete. Well, I did say the Atari is getting obsolete for Web surfing, but I also said if it does what you want and you're happy with it, that's good. I'm not out to convert anyone to the dark side. I don't care WHAT you use. If you're happy with an 800XL, more power to you. I'm just offering opinions that aren't necessarily in line with the majority in this newsgroup. Nothing more, nothing less.

Hello Bob

The Milan is delivered with Draconis isn't it ? So I think you can use it
to view your JPEG pictures.
There also exist a very good picture viewer called GEMview 3.17 . As far
as I know (and because it's slow on Falcon) it only relies on the CPU.
It's GEM interface is very good (drag'n drop etc), and I think on Milan it
should be reasonnably fast. You can find it on most Atari ftps.
GEMview is shareware.

Vincent

The opposite could be said as well:

MiNT-Net has existed and supported PPP with PAP/CHAP and various
Ethernet cards for ages. It also supports industry-standard NFS
and SMB filesharing, plus encrypted sockets in SSL and SSH.

iConnect isn't there yet.

Should be fairly easy. I have the sources here. The only
difficulty is that there isn't a ready-made mint target, so
one would need to examine each header and create one in the
Makefile.

> Do you really think that the ASH guys are morons?

Unfortunately, they have proven that several times.

> Emailer, Fiffi, Chatter, Teli, Ifusion and CAB... [...] the

Pine, ncFTP/aFTP, ircII, Telnet, CAB.

So, what is there to brag about about those MagiC software?
Color icons, maybe?

> According to several reports SUSE is compiling the latest
> LINUX version, for the Milan II, where will this leave
> MintNet? in the trashcan ?

Linux cannot run AES 4.1 yet. MiNT can, so we get the best of
both worlds: Unix tools and GEM applications.

3526. Re: MIDI Keyboards on Ataris

Newsgroup: comp.sys.atari.st
Date: 1999-12-06 00:00:00 UTC
From: mub046 <P.L.Flieshman@student.salford.ac.uk>
Message-ID: <384BF5E2.C7EA56CF@student.salford.ac.uk>
Source record: 69417

Okay, here's the quick guide to MIDI. MIDI is only ever control information...telling the synthesizer when to play notes etc etc pitch bend yadd yadda. It is therefore different from D2D, which is like a tape recording of a real sound that occured (without the tape!).

You can buy keyboards very cheaply that act only as an input controller for MIDI data. They therefore have no sounds of their own. This is cool if you already own samplers/synth modules etc. If you're starting from scratch, you can also buy a keyboard with sounds, and use it as your controller and your sound source in conjunction with any MIDI sequencer program (Logic/Cubase/Notator etc etc etc) . Hint; if you ar eworking with one device as controller and module, you must set the keyboard to something like LOCAL OFF. This is usually in the keyboards' GLOBAL, UTILITY, MIDI, MASTER or similar menus. This means that it only makes a sound when told ny the sequencer, NOT the keys....of course, with the sequencer on, you can play the keyboard normally, as the key data goes from the keyboards' MIDI out to the MIDI IN of the ST/Falcon, throuh the software, then straight out to the MIDI OUT to the MIDI IN on the keyboard (hint..this is the way that you connect it all up!). Without this local off, you will hear strange doubled notes. As to larger setups...MIDI THRU ports are very common, and generally clone what appears at the IN port. This means that you can daisychain devices. A more elegant solution is to buy a MIDI thru splitter, which provides several parralell THRu outs. This also minimises the posssiblities of MIDI delays because you MIDI leads are too long (although at home you can get away with quite a lot!). You also will need to set each device to respond ony to a specific MIDI channel, so that when you write a part on your sequencer, you don't hear it being played with all the voices simultaneously (e.g. the piano plays the drumparts along with the drums).

Sorry if this sounds a bit patronising. Good luck!

P.S, MIDI is a data standard...if it vsays MIDI on it you can hook it up to your Atari. Atari's rock for MIDI...I use a Falcon a sequencer and a sample editor in conjunction with my p200mmx wintel box and my Akai S01 and S900 samplers, my dummy keyboard and my Korg 05/RW synth module. It rules!

Mail me/post on the group if you get stuck.

Paul Flieshman
3rdkind Production team

P.S. If you have D2D on the Falcon, are you using Cubase Audio Falcon? In my opinion Cubase is the best MIDI sequencer, and you might already own it...Harddisk recording AND MIDI sequencing on the same platform, and it came out in '92...what a machine!

Don't know. I have used a TT with an Eizo Flexscan in TT High, and
the same monitor at the same resolution but in VGA mode with a Hades
and the TT High/ECL connection is undoubtedly better.

Thanks for the advice re. Gemview, but it does not seem compatible, at least the display seems to distorted into bands or something. Image Copy is the same. I have tried all viewers on all the CDs, ST and Format I have, and none work. As for using Draconis, that approach is of course possible, but I might as well use CAB 2.7. What I want is to be able to click on a JPG, and up it comes.

Bob King.

Pirate software? I don't know about you, but I don't see Captive on the shelves anymore, and haven't for quite some time. If it hadn't fallen into public domain, I doubt all the Atari sites out there (Including the little green desktop) would be happily advertising that they have the medway boys archive, which includes Captive. Do you really think any company that used to make game for the ST care whether people copy them now ? They're not selling them, and probably have no intention to ever do so again. And like I said, I used to play it some odd 8 years ago, and I didn't have a pirate version. The disk is still at my folk's place too... But that won't help me since they are thousands of miles away, and it likely still won't run on PaCifiST.

And the reason I asked on this group is because I've only ever seen Captive for the ST, and didn't even know there was a PC version... And none of my friends knew either... So I figured my odds of finding someone who would know the answer would be a lot better in the Atari community.

Try to be constructive next time.

Patrick.

Probably because very few actually have the possibility to test DHCP.

> I'm convinced that MagiC will be able to address that card, and knowing

Hmm, if this SLB is basically a shared version of the socklib for
IConnect, then we can easily write similar, compatible SLBs for STiNG,
MiNT-Net and Draconis. I guess ASH really *are* moving on! ;-)

I'm not surprised. Netscape is a nice browser, but it's well known for being prone to crashing.

>To be fair, though, this was using the first or second official build of

That's a little unfair, considering many pages cause CAB/Magic to crash (or at least they used to). There's the "Huge Font of Death," among others (though I think they fixed that one).

Towards the end I was mainly using my Atari for Internet applications, and while Okami is a nice reader, CAB tended to piss me off more than it gave me enjoyment. Then my Falcon crapped out on me, forcing me to make a decision, and it was a fairly easy one (considering I'd been looking at PCs anyway). I haven't looked back once. No desire to even try an emulator.

>shrine of anti-Microsoft sentiment. There are Mac users who think this

A lot of PC users, too. I'm no MS fan (I'm rooting for the USDJ all the way, even though I don't necessarily agree a lot of their arguments), but I'm going to use what works best for me. At first I tried to make Netscape my primary browser, but too many crashes convinced me to switch. And now I I pretty much prefer IE5 anyway, even without considering stability.

Have you tried ICAB or whatever it's called on your Mac?

>On an Atari you are never without an OS: much safer!

True, but I really don't think it's much of an issue. Especially with newer
PCs, as you said. I believe my Compaq has a CD driver in its BIOS. If I
have a CD in the drive when I boot up, it almost immediately asks me if I
want to boot from it.

I'll trade an Internet-upgradable OS any day over an OS in ROM. I don't
think the very slight increase in safety outweighs the advantages of having
an OS on disk.

I use one to share a modem between two computers (a Falcon and a PC).
The only thing to watch is the connectors at the back. Most switch boxes
I've seen are 25 way D connectors (3 female usually). I think you'll need
to make sure you get the correct cables or gender changers to connect the
box and computers.

I agree, although you don't have to read postings online. I have used Okami and had it set up ok after what seems ages trying and although the extra filtering and personal tailoring settings are nice, I *personally* didn't find it any better than NEWSie - which once you get used to the program and it's quirks is a good and quick program for novice and experienced user alike. I think a lot of users who have attempted to use Okami would say otherwise - This imho could be improved by much better docs. This said I personally know of other Atari users who *love* Okami and I think that sums it up - personal taste. Please refer to my previous posting about reading offline postings being readable while online using NEWSie.

All the Best

The different is that N_AES is installed on harddisk and can be removed if
one doesn't like it but according to *rumours* MagiC will come into ROM.
I believe however it will still be possible to use N_AES.
Furthermore now MagiC is available for the Milan I can imagine that you
are not oblied to buy N_AES anymore.

>
>Anyone else similar problems?

AFAIK the B5 was written to overcome the problem with the latest HDDriver
version (7.7=>).
As you maybe know with the latest HDdriver it's impossible to access
SCSI-devices. According to Uwe Seimet that's a problem of the Hades
because the SCSI-routines used aren't fully compatible with the TT
SCSI-routines.
Fredi Aschwanden knows about the problem but it seems he doesn't do much
about it. Sure he wrote B5 which acording to him should work but on my
Hades it surely doesn't work. All I get is a very slow machine with no
SCSI-access at all.

The only way I can access my SCSI-devices when I use HDdriver 7.7x in
conjuction with B4 is by switching off the 'Instruction cache'.

Last year my Falcon died on me when after putting in a ide drive, the power supply died. Since then the falcon has been sitting in pices awaiting for the day I could afford a new supply.

Last month after some people moved out of a trailer here and while I was cleaning it out I found an old 286 clone. I've played with it but without a bootdisk it's useless. Now I'm wondering, could I remove the power supply and wire it into the falcon? If so, does anyone know which wires would go were?

remove <*> for e-mail.

Hi there,
Any PC power supply will do. The Falcon
needs +12 volts, +5 volts and Ground. You have to
wire the Falcon plug to the power supply so that the
one blue wire (+12 volts) goes to a yellow wire on
the PSU (Power Supply Unit) the 4 black wires
(ground) to any of the black wires on the PSU and the
3 red wires (+5 volts) to any red wire on the PSU.
Never mind any of the other wires on the PSU they are
-12 volts and -5 volts which the Falcon doesn't need.
I hope that helps you out.

Joshua.

3547. Re: MagiC News(MagiC 7, New Webbrowser, MM 6.1.4)

Newsgroup: comp.sys.atari.st

that's a news to you, you can be excited about that.
Don't you feel like a little lagged?
Within our own "community" there is a huge difference in technology.

> Even if I have to admit, it is not like 10 years ago, when there was a new
> PD disk, with all kind of strange programs, almost every week.

1)If you really look around, it very close to.
I know I can't keep up with all updates, and new programs.
2)Development is different, in a good way I would say:
At the time there was not much softwrae, so anything had to be done, with
very little restriction, with very little hardware constraint. So writing
plenty of nasty code was very fast.
Now as of today, machines, tos revision, multitasking, nvdi, g.card. This
is not the same thing anymore. Writing something compatible is a bigger
task than writing few lines. Programmers are actually starting to follow
atari standards. (well, some people didn't really help (magicos for
example messed my days many times, I just don't care about magic anymore
to support).
So it is a good thing.
Also programing is most of the time created by a need. How many editors
have to be coded until one really makes the difference. Then people start
using it. and the need is not as strong. So less development in this area.
Web browser is a need. but is a HUGE project. (need to know the in&out of
sockets, multithreading, all picture format unpacking, keep up with
javascript, html tags constently changing, correct GEM programing and
STILL having the constraints of that it NEEDS to run on a 520st).

Now that is quite discouraging.

Bengy, Dennis and others:

Tell me what you think of a setup like that:

a pentium 133mhz 128meg with magicpc 6.0 with nvdipc 5.x, with iconnect,
cab and all latest with jinnee with a dual ISDN line.

I know some people might drool over that setup.

Lemme tell you, this setup really stinks, blows, pathetically
sucks, now you all want to push us to use magic? for that? please don't do
that to me, your MagiCal world is probably taking off (see milan II with

magicos, hadesmagic),
Atari world as I know it, is ending.

(btw, iconnect is as slow/shaky as stik was, so I really don't get why you guys get so exited about it). When CAB resolved, it temporarily "lock" the other connection, also slowing it down. Of course it can't be a setting problem, coz it is dummy-proof, And there is no such option anyway. So it is a design problem, But I thought I heard you said it was the best. Geez what a reference. Thank god I know what the best I can get on my atari is.

3549. NO LONGER MISSING! Adventure International Masters, alphas, and other stuff available...

Newsgroup: comp.sys.atari.st
Date: 1999-12-06 00:00:00 UTC
From: DauthiSlayer <Piratedman@hotmail.com>
Message-ID: <s4oe7gffqeg50@corp.supernews.com>
Source record: 69440
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

```
==================================================
A few years back- I came across, a large group of Adventure
International, software etc. Basically I've got boxes and boxes
of disc- in small cases) usually it's one game per case- and within
the case are usually 3-6 disc. Some of these are normally alpha or
"prototype" versions of the game and it usually contains what is
labeled a "Master" disc.
AI had been based in the Orlando area, and this stuff had been
placed in storage and ultimately sold for non-payment of rent. It
would seem that this was the Adventure International "archives" or
perhaps the separate backup storage- that was then lost or
abandoned, Much of the stuff is AI, but some is under another
name- so I suspect that they either succeeded Scott Adams'
Adventure International- or perhaps obtained the rights to some
of the stuff.(or were a spin-off).
I got only about 1/3 of what was available- but it includes Atari 8
bit, St, Commodore, 64, TRS-80 etc. But still there are probably
100 or so separate cases- and maybe 500 separate disc.
There is also some cassette based software.

My interest is primarily the cartridge based games....
Any idea what this stuff is worth?
Offers? ....
I'd rather move this as a group/lot-
But if there is some particular title- you really have to have-
if your offer will make it worth my while, I'll pull all this stuff out
and search through it for specifics.

Try GrafTool:

http://ourworld.compuserve.com/homepages/JJvB/

It's AV-aware, quite fast, and works very well as an external viewer for
CAB. There's no support for progressive JPEGs, though.

You could do, but you should verify the output level and
stability, especially if it's salvaged from such an old
machine. No point putting a replacement power supply in
if it's going to feed excessive noise and/or incorrect
voltage into the Falcon motherboard.

Besides, a new PC PSU is not very expensive. Certainly
worth the extra investment if it protects your beloved
Falcon.

| . . .
|AFAIK the B5 was written to overcome the problem with the latest HDDriver
|version (7.7=>).
|As you maybe know with the latest HDdriver it's impossible to access
|SCSI-devices. According to Uwe Seimet that's a problem of the Hades
|because the SCSI-routines used aren't fully compatible with the TT
|SCSI-routines.

That is very interesting and perhaps explains the problems that I have been having with an external scanner and an internal CDR, both on the SCSI bus (even with B4). The DMA routines apparently only simulate those on the TT and Roger Burrows of Anodyne Software has been working hard trying to get a driver to work properly on my Hades.

|Fredi Aschwanden knows about the problem but it seems he doesn't do much
|about it. Sure he wrote B5 which acording to him should work but on my
|Hades it surely doesn't work. All I get is a very slow machine with no
|SCSI-access at all.

I could get access to the CDR (reading only) but I did not try the scanner. My HDDriver seems to be 7.61.

I don't think this is the case, as MagiC-Milan needs TOS to work.

> I believe however it will still be possible to use N_AES.

It will.

> Furthermore now MagiC is available for the Milan I can imagine that you
> are not oblied to buy N_AES anymore.

No, you're obliged to buy MagiC instead... I think both options are
equally bad, it should be possible to buy the Milan without having to pay
extra for an OS most people already own.

There's yet another reason for the tar/gzip to crash: he is trying to
unpack
an archive which contains long filenames, under TOS, or even under MiNT,
but on the TOS filesystem. TOS does _not_ tolerate it, and I guess that
an old version of MiNT (1.12.6 for example) would behave similarly.

tar/gzip pair is not only easy to use (in a proper setup), it is also fast
and produces
short archives (about 10% better packing than lharc 3.10, with 10% speed
loss).

I agree, very few of the tar/gz archives i have have de-comp'd
properly or at all. What also p's me off is an archive thats been
converted into about 3 formats, with the final archive type being
crapped

I do. I've noticed the same thing. On most Atari fontselectors that
I've seen and used, when you go to change the font, the list opens up
with the previously selected font highlighted and at the center of
the display. With WS3, the selector takes you all the way to the top
every time. If you want to change to a font near the one you want, or
if you accidentally chose the font above the one you wanted, you are
forced to scroll down the list again through possibly hundreds of
fonts. This is quite annoying. Also, wouldn't it make sense that
starting closer to the center of the list, you have a shorter
distance to go in either direction to most fonts?

Aren't we all some kind if beta tester nowadays? The Atari market is so
small that most programmers can't afford an army of beta testers to test
out their programs.
Oke, in the case of Wensuite one is paying some good money for a beta
program but on the otherside once you have paid you can get all the newer
version for free from their homepage.
Tell me can you do this also with Draconis, Cab, etc.. ?

After reading what I wrote yesterday I think I wasn't very clear. The
SCSI-routines used on the Hades aren't not fully compatible with the
SCSI-routines of the TT which seems to be regard as the standard.

Hmm, I've an internal SCSI 32x CD-ROM and an external SCSI HD. Both can be
accessed without any problem as long as I use HDdriver 7.60.
With HDdriver 7.71 or 7.8 I just can't unless I switch off the
'instruction cache'

I'm using HDdriver 7.60 without any problem.

Oh, don't mind these boys. They just, as always before, use any occasion
to postpone the freeware competitor (FreeMiNT + MiNT-Net), because
